

AMERICAN RIVER BASIN

Storm Water Resource Plan | February 2018

Public Draft

Funding for this project has been provided in full or in part through an agreement with the State Water Resources Control Board using funds from Proposition 1. The contents of this document do not necessarily reflect the views and policies of the foregoing, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

Table of Contents

1.0	INTRODUCTION	1
1.1	Intent and Content	1
1.2	Goals and Objectives	2
2.0	WATERSHED IDENTIFICATION	3
2.1	Watershed Boundaries (IRWMP Section 2.1).....	3
2.2	Internal Boundaries (IRWMP Sections 2.2, 2.8, & 2.9).....	5
2.3	Water and Environmental Resources (IRWMP Sections 2.6.2, 2.6.3, & 2.8).....	11
2.4	Natural Watershed Processes (IRWMP Sections 2.6.1, 2.6.2, & 2.6.3).....	13
2.5	Watershed Issues and Priorities (IRWMP Sections 2.6.2, 2.7 to 2.9, & Apdx. B).....	16
3.0	WATER QUALITY COMPLIANCE	19
3.1	Activities that Degrade Regional Water Bodies	19
3.2	TMDL and Permit Compliance	19
4.0	ORGANIZATION, COORDINATION, AND COLLABORATION	24
4.1	Stakeholder Identification	24

Appendix M	Watershed Analysis and Modeling Approaches for the ARB Region
Appendix N	Call for Projects Template

1 **1.0 INTRODUCTION**

2 **1.1 Intent and Content**

3 This document is a stormwater resource plan (SWRP), which describes the start of an ongoing process to
 4 identify watershed-based runoff management methodologies for the American River Basin (ARB) in
 5 northern California. This SWRP contains processes for developing and implementing projects and
 6 programs that manage stormwater and dry weather runoff to improve water quality, reduce localized
 7 flooding, increase water supplies, protect the environment, and enhance communities. Projects will be
 8 developed both for new development and for existing landscapes to restore watershed processes and provide
 9 a variety of benefits.

10 In addition to better managing stormwater on a watershed scale, this SWRP allows runoff capture projects
 11 to be eligible for certain state grants, so long as those projects adhere to the eligibility conditions of each
 12 grant. California Water Code §10560 et seq. (as amended by Senate Bill 985) requires a SWRP as a
 13 condition of receiving funds for runoff capture projects from any water bond measure approved by voters
 14 after January 1, 2014. The amended Water Code also requires the California State Water Resources Control
 15 Board (State Water Board) to develop guidelines for developing a SWRP. This SWRP is based on and
 16 includes the required elements of those guidelines (State Water Board 2015c) and the Water Code.

17 In accordance with the Water Code and SWRP guidelines, this ARB SWRP is being submitted to the
 18 Regional Water Authority (RWA), the regional organization that oversees the Integrated Regional Water
 19 Management Plan for the American River Basin (ARB IRWMP, RWA 2013). The ARB IRWMP identifies
 20 regional approaches to provide long-term reliable water supplies for urban, agricultural, environmental, and
 21 recreational water needs. Many of the elements presented in this SWRP are based on information or
 22 processes already identified or used by the ARB IRWMP, with new methodologies and tools developed
 23 and integrated as required. Upon submittal, the RWA will incorporate the SWRP into the IRWMP.

24 Table 1-1 summarizes the required SWRP elements and the relevant sections of the SWRP guidelines,
 25 Water Code, and ARB IRWMP. Appendix A of this SWRP provides a self-certification checklist of the
 26 elements and provisions (sub-elements) required by the guidelines, including relevant section references.

27 This SWRP is a “living document.” It outlines regional plans for adaptive management, which provide
 28 stakeholders opportunities to modify, update and improve watershed management methodologies, along
 29 with developing and implementing current and future projects. Ultimately, this SWRP provides a
 30 framework for achieving regional goals to manage stormwater and dry weather runoff as a resource and
 31 maximizing multiple water quality, water supply, flood control, environmental, and community benefits on
 32 a watershed scale.

33 **Table 1-1. Water Code and SWRP Guideline Elements**

Element	SWRP Guideline Section	Water Code Section	ARB SWRP Section
Watershed Identification	VI.A	10565(c) 10565(b)(1)	2.0
Water Quality Compliance	V	10562(d)(7) 10562(b)(5&6)	3.0
Organization, Coordination, Collaboration	VI.B	10565(a) 10562(b)(4)	4.0
Quantitative Methods	VI.C	Not applicable	5.0
Identification and Prioritization of Projects	VI.D	10562(b) (2&8) 10562(d)(1) to 10562(d)(6)	6.0
Implementation Strategy and Schedule	VI.E	10562(b)(7) 10562(d)(8)	7.0
Education, Outreach, Public Participation	VI.F	10562(b)(4)	8.0

1 **1.2 Goals and Objectives**

2 This SWRP outlines regional strategies for undertaking runoff capture projects that provide water supply,
 3 water quality, flood control, environmental, and community benefits. These directly align with the goals
 4 of the ARB IRWMP, as demonstrated in Table 1-2. Likewise, this SWRP adopts the objectives of the
 5 IRWMP, as shown in Table 1-3.

6 **Table 1-2. SWRP and IRWMP Goals for the ARB Region**

SWRP Goal	IRWMP Goal (RWA 2013)
Increase water supply	Provide reliable and sustainable water resources, sufficient to meet the existing and future needs.
Improve water quality	Protect and enhance the quality of surface water and groundwater.
Support flood management	Protect the people, property, and environmental resources of the region from damaging flooding.
Protect the environment	Protect and enhance the environmental resources of the watersheds within the region.
Enhance communities	Promote community stewardship of the ARB region’s water resources.

7 **Table 1-3. SWRP and IRWMP Objectives**

SWRP and IRWMP Objectives (RWA 2013)
1. Meet current and future water resources needs. *
2. Increase water use efficiency. *
3. Improve ability to reliably meet water demands during dry or emergency conditions.*
4. Increase the use of recycled water for appropriate uses.
5. Remediate contaminated groundwater and reuse it to the extent feasible.
6. Improve protection of beneficial uses of surface water and groundwater. *
7. Recharge and reuse stormwater and urban runoff to the extent practicable. *
8. Maintain and improve the ecosystem function of area streams and watersheds. *
9. Maintain and improve habitat of area watersheds. *
10. Conserve natural riparian buffers in undeveloped portions of local watersheds and restore buffers in developed areas when possible. *
11. Increase the capacity of the flood management system to meet applicable standards for designated areas and land uses. *
12. Maintain and improve levees and other flood-related infrastructure to reduce flood risk.
13. Maintain and restore/reconnect floodplains to provide flood storage and other benefits.*
14. Improve management of residual flood risks.*
15. Increase awareness of the need for, benefits of, and practices for maintaining sustainable water resources.*
16. Improve integration of water resources planning with land-use planning.*
17. Increase sharing of information, studies, and reports to further advance integrated regional water management.*

8 **Indicates priority objectives for the SWRP.*

2.0 WATERSHED IDENTIFICATION

The ARB IRWMP provides extensive information, including detailed maps, regarding the ARB region’s watershed boundaries, resources, priorities, and natural watershed processes. This section summarizes that information and includes references to specific sections of the 2013 IRWMP where applicable, as denoted in parenthesis after each subsection title.

2.1 Watershed Boundaries (IRWMP Section 2.1)

This SWRP’s boundaries include the watersheds associated with the existing ARB IRWMP (Figure 2-1). These watersheds are designated as United States Geological Survey (USGS) hydrologic unit code (HUC) 8 watersheds as identified in Table 2-1.

The IRWMP boundaries include the region’s major water bodies, groundwater basins, agricultural lands, and highly urbanized areas, but do not include all portions of the affiliated watersheds. To meet the inherent definition of a watershed-based plan, the SWRP boundaries include these watersheds in their entirety, although projects and objectives will focus on the specific needs of the ARB region.

Figure 2-1. ARB SWRP Watersheds and Vicinity

Although the SWRP covers some watersheds not draining to the American River, the plan is titled the “American River Basin Stormwater Resource Plan” to reflect the close relationship between this plan and the ARB IRWMP. As identified in the IRWMP, the ARB region was defined based on the key surface water bodies cited above because collectively they provide a substantial portion of the region’s water supply. These and other surface water bodies are shown in Figure 2-2. The portion of the Sacramento River that runs by the City of Sacramento and Sacramento County acts as the western boundary of the ARB region.

A SWRP that includes the watersheds associated with the ARB IRWMP is deemed appropriate because the IRWMP already manages water resources under a regional multi-benefit approach. Inclusion of runoff management practices that seek to achieve the same, multiple benefits is a natural fit.

Table 2-1. HUC 8 Watersheds of the ARB Region

Watershed	HUC 8 #	Watershed	HUC 8 #
Lower American	18020111	Upper Coon-Upper Auburn	18020161
Upper Bear	18020126	Lower Sacramento	18020163
North Fork American	18020128	Upper Mokelumne	18040012
South Fork American	18020129	Upper Cosumnes	18040013

1
2 Figure 2-2. ARB SWRP and IRWMP Boundaries and Primary Water Bodies (RWA 2013)

2.2 Internal Boundaries (IRWMP Sections 2.2, 2.8, & 2.9)

The ARB region has historically supported agriculture, with the City of Sacramento located at the confluence of the American and Sacramento Rivers and serving as a regional hub since the gold rush era and the state capital since four years after statehood. In the past several decades, urban and residential development have spread from Sacramento outward – upstream and easterly, along the American River, toward Folsom and El Dorado Hills; north into the Natomas Basin and western Placer County; and south to the cities of Elk Grove and Galt. Today, the region still contains considerable agricultural land in private holdings, but it is rapidly urbanizing. The result is a densely populated region, with many complicated water resource-related needs. Despite these challenges, the region has many well-established agencies that independently and collectively address local and regional needs associated with sustainable water management. The following sections describe the relevant municipalities; water, wastewater, and land-use agencies; and groundwater basins. Table 2-2 lists these agencies and the relevant services each provides. Several of these entities will be key players in implementation of SWRP projects.

Table 2-2. Water-Related Agencies within the ARB Region (RWA 2013)

Agency	Water-Related Activities

1 *Agency is a member or associate of RWA, the ARB IRWMP managing group

2 **Groundwater Sustainability agencies (GSAs) are listed in Table 2-4.

3 **2.2.1 Water, Wastewater, and Land-use Agencies**

4 Appendix B1 of this SWRP includes boundary maps of the region’s water and wastewater agencies and
 5 treatments plants, stormwater and flood management agencies, and land-use agencies, as provided and
 6 described in detail in the ARB IRWMP. The summary excerpts provided below offer an overview of these
 7 agencies. Geographic Information System (GIS) shape files of the agency boundaries may be obtained by
 8 contacting RWA (i.e., the regional group overseeing the IRWMP).

9 Folsom Dam on the American River and Shasta Dam on the Sacramento River are multi-purpose reservoirs
 10 that provide flood control, water supply, recreational use, and ecosystem support upstream of and within
 11 the ARB region. In addition to these reservoirs, there are 15 surface water treatment plants (WTPs) and 14
 12 groundwater treatment plants that support the region’s water supply, as well as groundwater wells operated
 13 by many agencies, some with onsite treatment. The Cosumnes River supplies a large proportion of the
 14 groundwater relied upon for water supply by agencies in the South American and Cosumnes Sub-basins.
 15 In addition, it is the surface water source for Rancho Murieta, all of the upper watershed communities, and
 16 agricultural diversions in the lower watershed. There are 28 water delivery agencies within the Sacramento
 17 County, western Placer County, and western El Dorado County vicinity. Table 2-3 lists the historic and
 18 projected water demands for each water supplier.

19 **Table 2-3. Estimated and Projected Water Demand (RWA 2013)**

Water Agency	Estimated/Projected Demand (AFY) ¹			WTP Capacity ² (afy)
	2005	2010	2030

Regional Total	844,002	779,819	952,714	1,141,917

¹ afy: acre-feet per year

² Ultimate capacities taken from ARB IRWMP (RWA 2013) Table 2-17. WTP capacities serve agencies beyond those with quantity attributed. For example, Placer County Water Agency WTPs provide water to Lincoln and Roseville, in addition to serving Auburn, Loomis, and Rocklin.

In Placer County, wastewater sewer systems and treatment plants (WWTPs) are operated by incorporated cities, the South Placer Utility District, and Placer County. The Sacramento Regional County Sanitation District (Regional San) provides wastewater conveyance and treatment services to residential, commercial, and industrial customers in portions of the unincorporated Sacramento County; the cities of Citrus Heights, Elk Grove, Folsom, Rancho Cordova, a portion of Sacramento, and West Sacramento (Yolo County); and the communities of Courtland and Walnut Grove. An exception is within the City of Sacramento, where the city owns and operates a substantial portion of the sewer collection system. The City of Sacramento also owns and operates a combined sewer system, which includes treatment facilities and associated collection systems. Wastewater services for El Dorado Hills, located in El Dorado County, are provided by El Dorado Irrigation District (EID) and their WWTP.

Flood management boundaries of the ARB region follow city boundaries as well as specific flood agency boundaries, including Reclamation District (RD) 1000, the American River Flood Control District (ARFCD), Maintenance Area 9, and the multiagency Sacramento Area Flood Control Agency (SAFCA). SAFCA boundaries encompass Sacramento County as well as the portion of Sutter County within the Natomas Basin.

Municipalities within the ARB region are responsible for their respective stormwater management systems. The County of Sacramento and cities of Galt, Folsom, Sacramento, Rancho Cordova, Citrus Heights, and Elk Grove share a Phase I Municipal Separate Stormwater Sewer System (MS4) permit and collaborate on many elements through the Sacramento Stormwater Quality Partnership (SSQP). The municipalities within

1 Placer County are subject to the statewide Phase II MS4 permit and coordinate through the Placer Regional
 2 Stormwater Collaborating Group (PRSCG). Section 3 provides specific details on the stormwater permits
 3 and programs.

4 Each city, town, and county agency within the ARB region conducts land-use planning activities, as does
 5 the Sacramento Area Council of Governments. Land-use planning activities are documented in municipal
 6 general development plans (General Plans).

7 **2.2.2 Groundwater Basin Boundaries**

8 Most of the ARB region overlies the North American, South American, and the Cosumnes groundwater
 9 sub-basins, as defined by the California Department of Water Resources (DWR). These sub-basins are
 10 bounded by the Sacramento or Feather River to the west and the Sierra Nevada Mountains to the east. The
 11 North American sub-basin boundaries are defined by the Bear and American Rivers, and the South
 12 American sub-basin boundaries are defined by the American and Cosumnes Rivers. The Cosumnes sub-
 13 basin lies between the Cosumnes and Mokelumne rivers. Each sub-basin has one or more entities that
 14 manage its groundwater, as listed in Table 2-4. The groundwater basins and their sustainability agencies
 15 are shown in Figure 2-4.

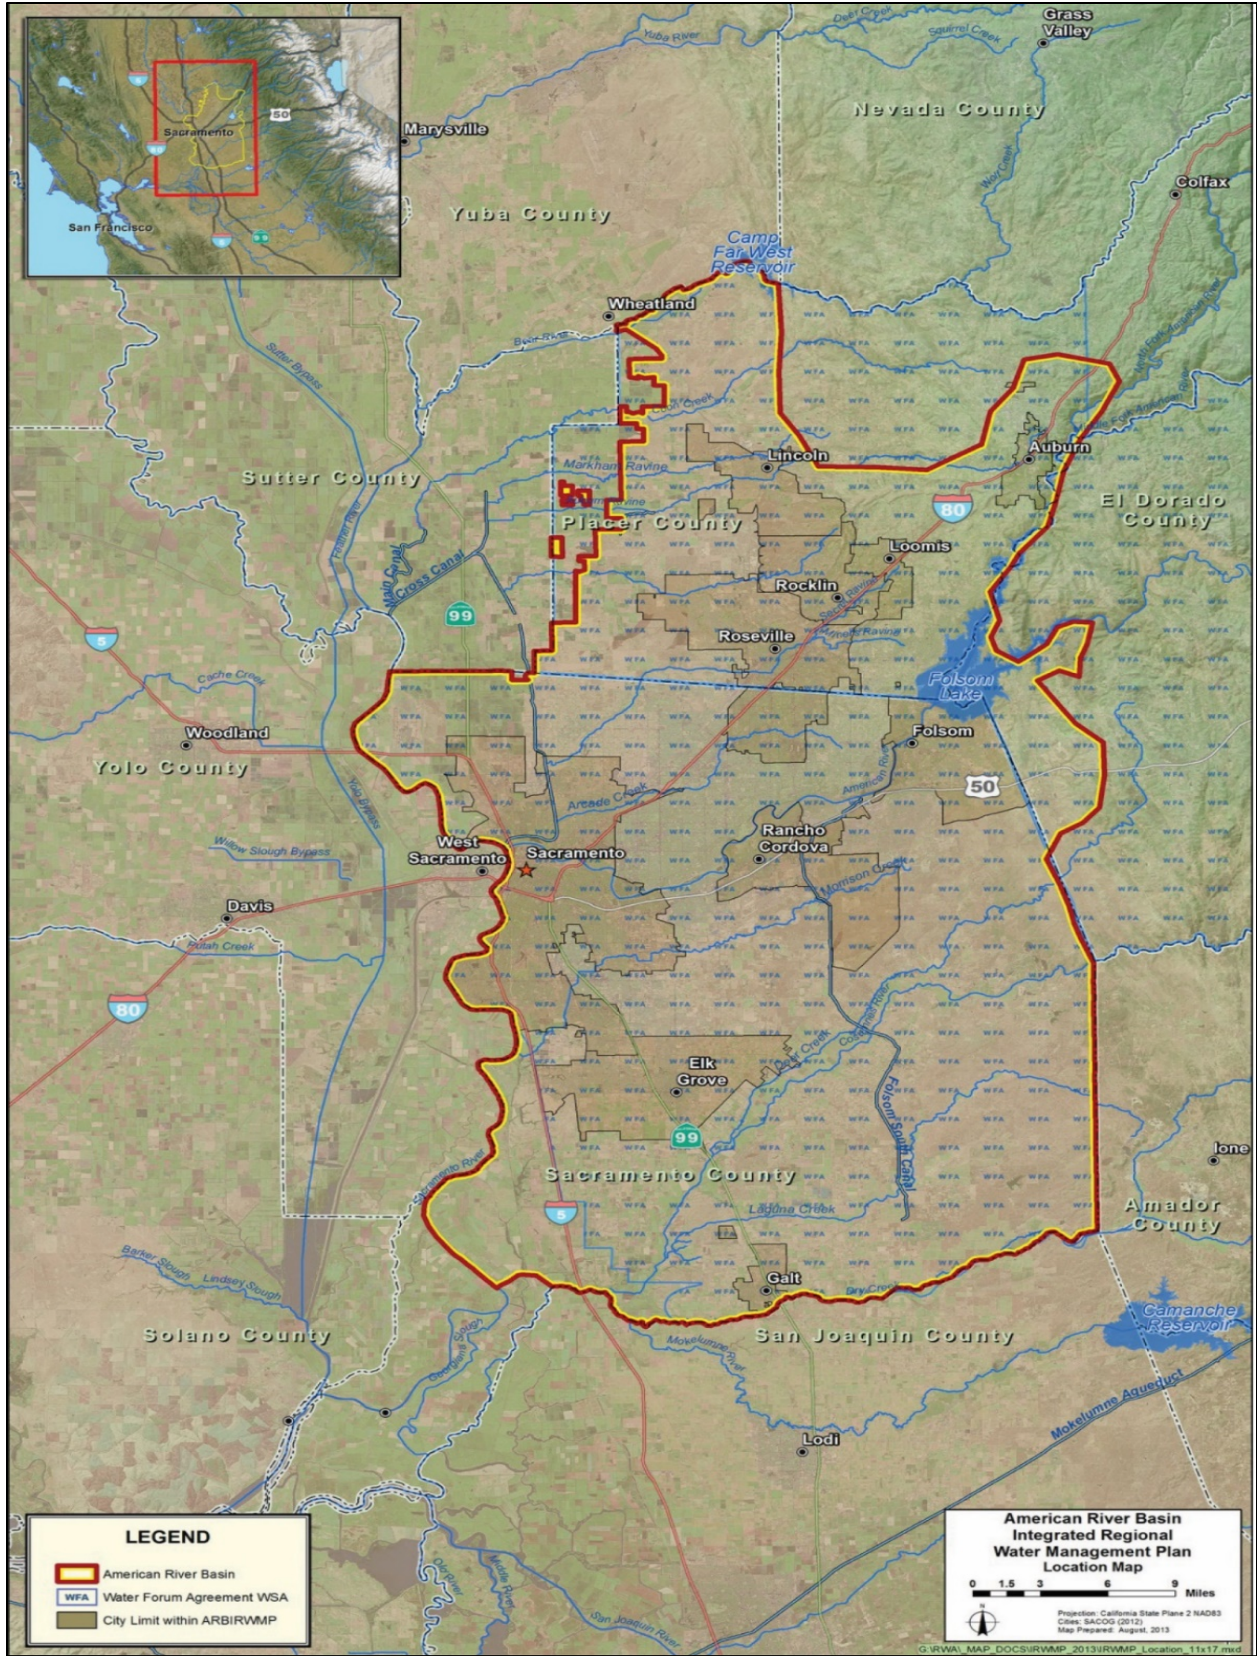

16 **Table 2-4. Groundwater Sustainability Agencies**

Groundwater Basin	Groundwater Sustainability Agency ¹
North American Sub-basin	Western Placer County Groundwater Sustainability Agency
	Reclamation District 1001
	Sutter County

	Galt Irrigation District
	Omochumne-Hartnell Water District
	Sloughhouse Resource Conservation District

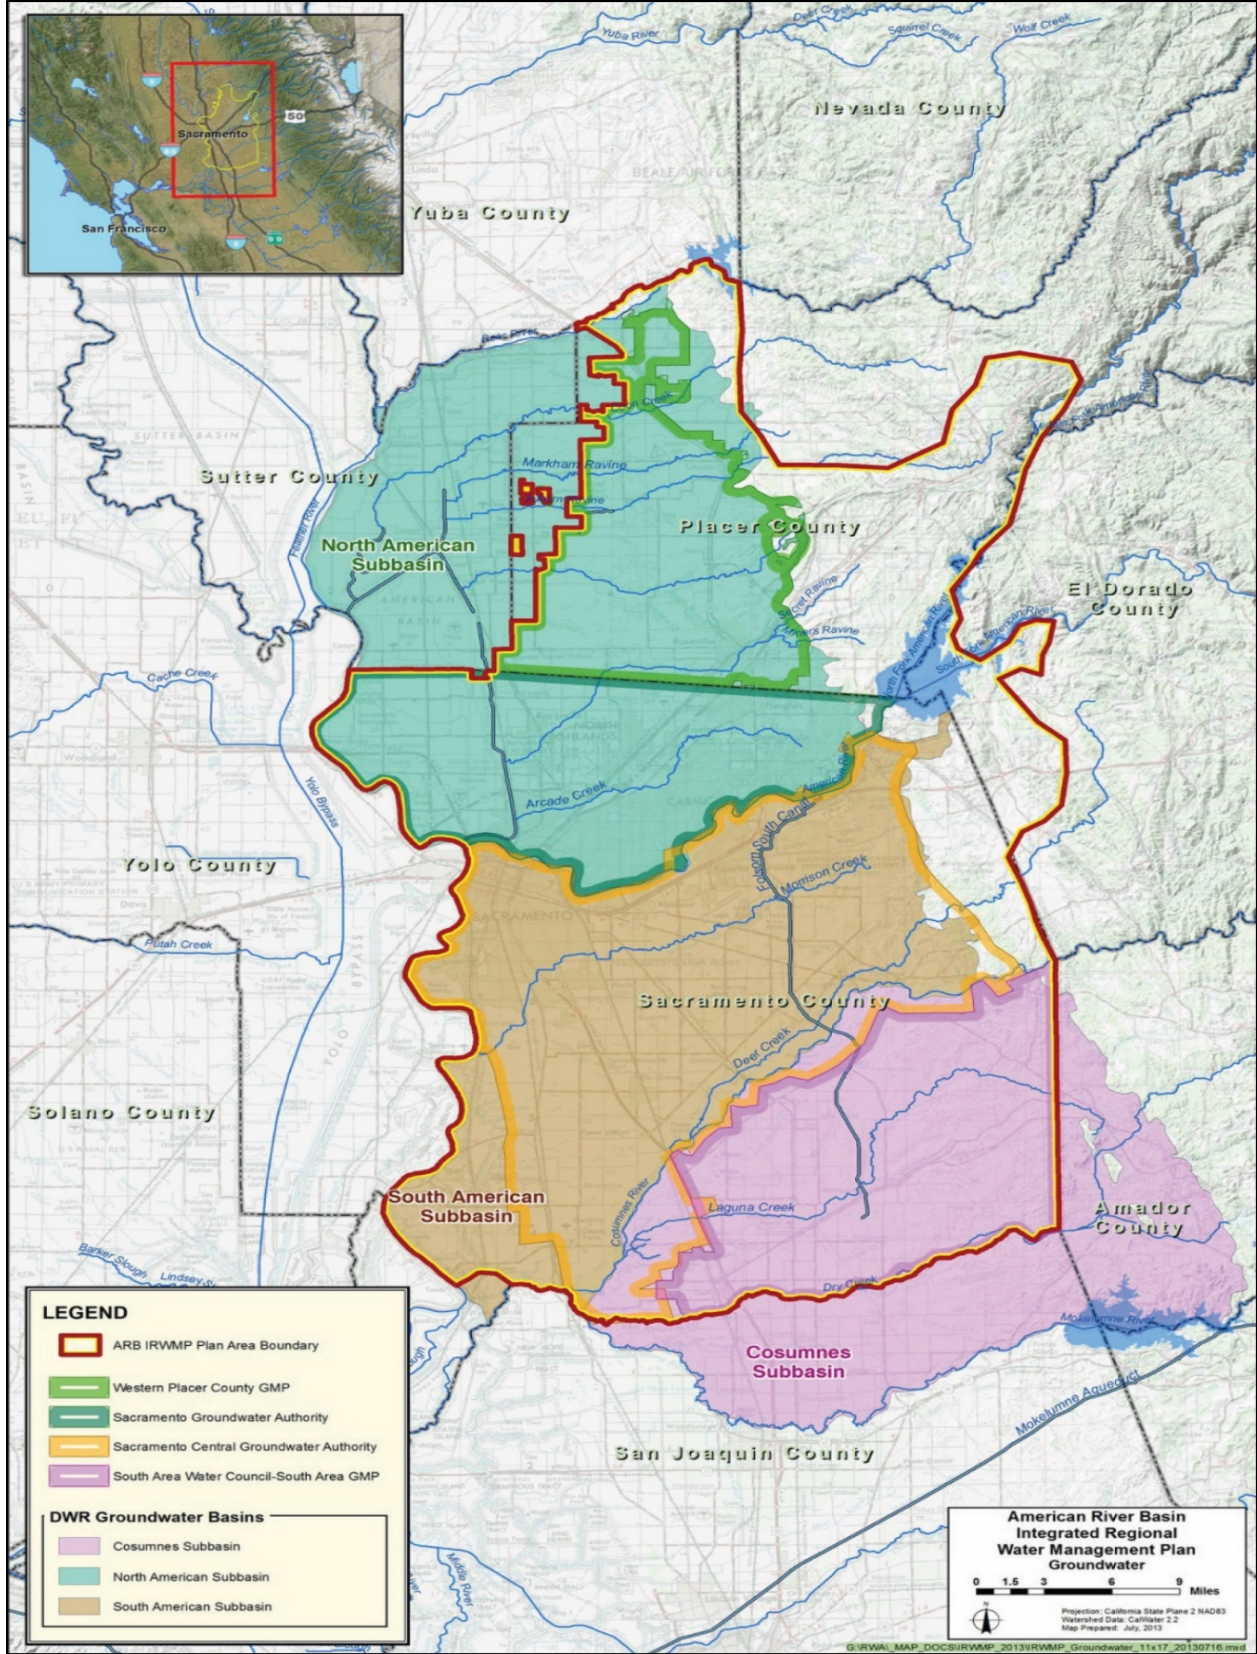

17 ¹DWR 2017

18 **2.2.3 Disadvantaged Communities**

19 The ARB IRWMP identifies the region’s disadvantaged communities (DACs). Unlike many areas of the
 20 state, most DACs in the ARB region are generally not isolated communities, but instead exist as pockets
 21 within larger communities. The water supply and water quality needs of the ARB region’s DACs are served
 22 by the larger community agencies, as described in the ARB IRWMP. The isolated DACs that do exist are
 23 served by small water systems and/or private wells. For these communities, issues with small systems
 24 water supply and sanitation are generally related to substandard, aging infrastructure, rather than larger
 25 regional issues. As of 2013, there had been no reported problems for small systems monitored within the
 26 region, and monitoring is being continued at the IRWMP level to determine if there are specific issues that
 27 should be considered.

1
 2 Figure 2-3. Municipal and County Boundaries in the ARB Region (RWA 2013)

1
2 Figure 2-4. Groundwater Basin Boundaries (RWA 2013)

1 **2.3 Water and Environmental Resources (IRWMP Sections 2.6.2, 2.6.3, & 2.8)**

2 **2.3.1 Surface Water Resources and Beneficial Uses**

3 Located near the Sacramento-San Joaquin River Delta, the ARB region includes a large portion of the
4 border between two of California's largest hydrologic regions as defined by the California Department of
5 Water Resources (DWR): the Sacramento River and the San Joaquin River. Generally, the southern one-
6 third of the ARB region is within the San Joaquin River hydrologic region and the northern two-thirds is in
7 the Sacramento River hydrologic region.

8 Figure 2-5 provides a diagram of the primary water bodies within the ARB region. Note that a small portion
9 (66 square miles) of the ARB region's southwestern corner is within the legally defined 1,233-square-mile
10 San Joaquin-Sacramento Delta. The ARB IRWMP provides 27 pages of extensive maps and narrative
11 details of the region's water bodies, including the locations of smaller, local creeks and streams, as well as
12 the hydrology, water quality, habitat and species, and management/stewardship of each watershed plus that
13 of the Sacramento River. Relevant maps are provided in Appendix B2 of this SWRP. GIS shape files of
14 the boundaries may be obtained by contacting RWA.

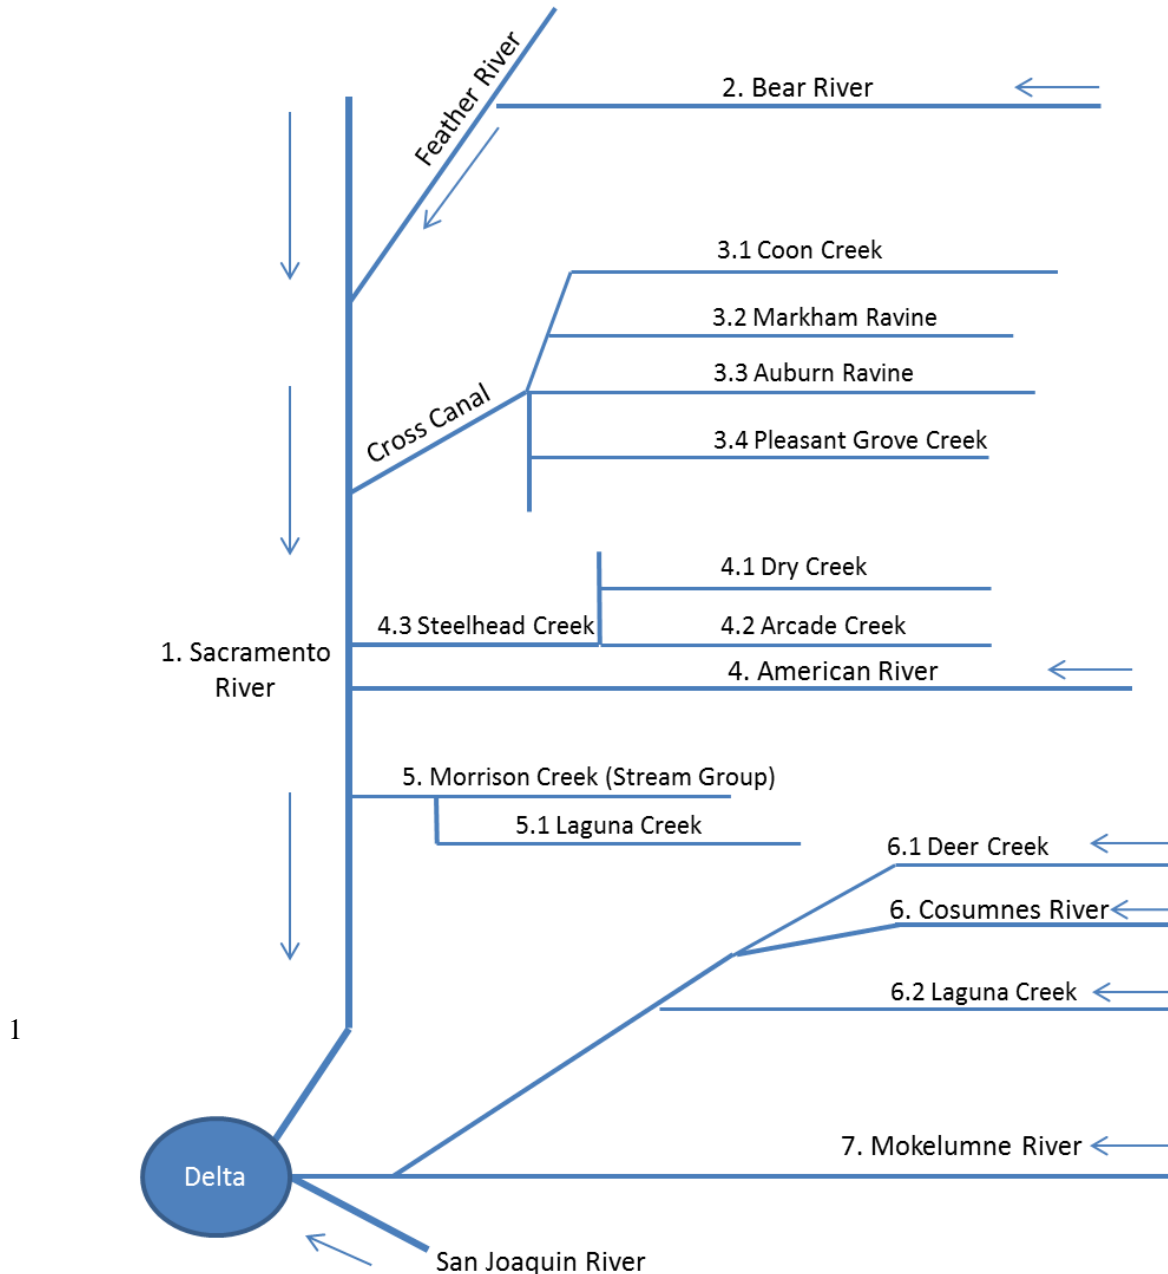

15 Beneficial uses of the Sacramento River and its tributaries within the region include municipal and domestic
16 supply, agricultural supply, contact and non-contact water recreation, warm and cold freshwater habitat,
17 migration, spawning, wildlife habitat, and navigation. Beneficial uses of the American and Bear Rivers are
18 the same as the Sacramento River, except they exclude navigation and include hydropower generation. The
19 Cosumnes River's beneficial uses are municipal and domestic water supply, agricultural supply, water
20 contact recreation, warm and cold freshwater habitat, fish migration, spawning, wildlife habitat, and a
21 source of water for the Sacramento-San Joaquin Delta. The Delta's beneficial uses include those for the
22 Sacramento River plus industrial service and process supply and groundwater recharge (Central Valley
23 Regional Water Board 2016).

24 **2.3.2 Groundwater Resources**

25 Groundwater is an important source of water supply within the ARB region and is an integral part of the
26 regional water resources setting. Groundwater supports a significant portion of the region's water needs,
27 and helps reduce impacts to water users in times of shortage. Efforts to increase conjunctive use in the
28 region have increased the use of surface water when available during wet and normal conditions, while
29 preserving and protecting groundwater resources for dry and critically dry periods.

30 The ARB region includes three groundwater sub-basins as introduced in Section 2.2.3 and shown in Figure
31 2-4 of this SWRP: the North American, South American, and Cosumnes sub-basins. The region has 14
32 groundwater treatment plants, as well as several groundwater wells operated by various agencies, many
33 with some form of onsite wellhead treatment. The ARB IRWMP documents in-depth information regarding
34 the region's hydrogeology, groundwater quality, and primary contamination plumes, trends, and sustainable
35 yields for each sub-basin. Maps of the sub-basins and relevant authorities are also provided. Detailed maps
36 are included in Appendix B2 of this plan.

37 All groundwater basins in the region are considered suitable or potentially suitable for municipal and
38 domestic water supply (MUN), agricultural supply (AGR), industrial service supply (IND), and industrial
39 process supply (PRO), unless otherwise designated by the Central Valley Regional Water Quality Control
40 Board (Central Valley Regional Water Board 2016).

2 **Figure 2-5. Primary Water Bodies within the ARB Region (RWA 2013)**

3 **2.3.3 Native Habitat**

4 While much of the habitat within the ARB region has been altered by urbanization and agriculture, some
 5 regions remain less impacted and provide important regional habitat for fish and wildlife. Habitat types
 6 include wetland, riverine, riparian forests, grassland, emergent marshes, oak woodlands, and vernal pools.
 7 A variety of breeding birds reside in the ARB region in the summer, including waterfowl such as mallard,
 8 gadwall, cinnamon teal, and wood ducks; herons such as great blue heron, great egret, snowy egret, and
 9 black-crowned night heron; songbirds such as song sparrow, red-winged blackbird, house wren, marsh wren,
 10 and spotted towhee; and raptors including Cooper’s hawk, Swainson’s hawk, and red-shouldered hawk.
 11 Located within the Pacific Flyway, the ARB region attracts large numbers of migratory birds including
 12 waterfowl such as canvasback, greater white-fronted goose, and green-winged teal, and sandhill cranes.
 13 Many other special status species call the ARB regional home such as vernal pool shrimp species,

1 Swainson’s hawk, sandhill crane, giant garter snake, western pond turtle, valley elderberry longhorn beetle,
2 yellow-billed cuckoo, Bell’s vireo, burrowing owl, tri-colored blackbird, and the tiger salamander.

3 A number of small mammals, such as river otter and beavers, depend on regional waterways. All the major
4 rivers and many smaller waterways such as the Dry Creek tributaries provide important habitat for fall run
5 Chinook salmon as well. While the Mokelumne and American Rivers maintain hatcheries for breeding,
6 the area creeks and the Cosumnes River support wild strains of these fish, thus serve as important habitat
7 to preserve genetic diversity of the fall run salmon. Many other native fishes such as hitch and eels also
8 frequent local streams and rivers. It should be noted that the ARB contains two key areas in the southwest
9 portion of region that provide rare wetlands habitat: the Cosumnes Preserve and Stone Lakes National
10 Wildlife Refuge. The Cosumnes Preserve is primarily managed for migratory water birds, particularly the
11 Sandhill Crane. Stone Lakes and the adjacent buffer lands, managed by Regional San, provides wetlands
12 utilized by dozens of birds, ducks and geese, and large migratory species as well as small mammals. The
13 ARB IRWMP provides detailed information regarding these habitats and species of primary importance for
14 each of the region’s watersheds.

15 2.3.4 Open Spaces

16 The communities in the ARB region have multiple open areas that preserve wildlife and natural resources,
17 as well as provide recreational opportunities, aesthetics, and tranquility. The region’s municipalities
18 identify recreation, parks, and open space in their general plans and establish relevant goals to assure quality
19 of life is sustained as communities grow. This includes plans to “retain open space, enhance recreational
20 opportunities, conserve fish and wildlife habitat, increase access to natural resource lands and water, and
21 develop parks and recreational facilities,” as cited in the Growth Management Act (GMA) of 1991. These
22 plans, which include maps of parks and open spaces, change periodically as new development or
23 redevelopment occurs. The plans are maintained by each community and are available on their websites.
24 Open space and park maps from the ARB region’s primary municipalities are provided in Appendix C of
25 this SWRP.

26 **2.4 Natural Watershed Processes (IRWMP Sections 2.6.1, 2.6.2, & 2.6.3)**

27 Watersheds perform three key functions (Figure 2-6): the transport and storage of water, nutrients,
28 pollutants, sediment, and other materials; cycling and transformations of materials such nutrient, carbon,
29 and minerals as well as the decomposition of plant material performed by microorganisms; and ecological
30 succession involving the evolution of plant communities near waterways and in upland areas. As illustrated
31 in Figure 2-6, precipitation is dispersed through multiple processes, including infiltration, groundwater
32 recharge, evapotranspiration, overland flow, and interflow or base flow.

33 The distribution of water within these processes is determined by several factors specific to the watershed,
34 including climate, land cover, topography, soil characteristics, and land use. These factors also influence
35 the delivery of sediment and organic matter to receiving waters, as well as chemical and biological
36 processes that affect water quality within the watershed’s landscape.

37 There is no quantitative estimate of these processes in the ARB region, but understanding the climate and
38 geology gives insight to the relative degree of those processes with respect to each other. Located between
39 the Sierra Nevada Mountains to the east and the Pacific Ocean and Coast Range to the west, the region
40 serves, hydrologically, as a thoroughfare for rivers and creeks carrying Sierra mountain drainage, to the
41 Sacramento Delta and, ultimately, the Pacific. The region’s water bodies (identified in Section 2.3.1) are
42 fed by moisture-laden, ocean air that drops heavy amounts of precipitation as it blows east, climbing the
43 Sierras. Its location between the ocean and mountains subjects the region to coastal and elevation
44 influences, so rainfall patterns vary. The average annual precipitation ranges from about 18 inches per year
45 in Sacramento to 34 inches per year in Auburn (about 1,200 feet above mean sea level; RWA 2013). The
46 hot, dry summers and wet winters coincide with higher evaporation rates during summer and lower rates
47 during the winter, respectively.

48

1
2 **Figure 2-6. Watershed Processes (USEPA 2017)**

3 The ARB region includes an upper aquifer system and a lower aquifer system whose formations are
4 primarily composed of lenses of interbedded sand, silt, and clay, interlaced with coarse-grained stream
5 channel deposits. The deposits generally thicken from east to west to a maximum thickness of about 2,500
6 feet under the Sacramento River (RWA 2013).

7 Shallow surface soils in the region range from very poorly draining to excessively draining (USDA SCS
8 1993), creating sub-regions with varying degrees of infiltration, overland flow, and interflow. Most of the
9 region’s shallow surface soils are underlain by cemented hardpan, clayey sediments, or consolidated
10 sediments, making deep infiltration and groundwater recharge difficult. In contrast, extensive sand and
11 gravel deposits exist along the American, Cosumnes, and Sacramento Rivers as well as numerous streams,
12 allowing for recharge of groundwater basins and creating land strips with high or perched water tables.
13 Ancient glacial gravel deposits can be found in the subsurface moving west and southwest from Lake
14 Natoma, coursing south of the Cosumnes River. These deposits could serve as routes for the movement of
15 groundwater and possible sites for infiltration where they approach land surface. In general, infiltration,
16 interflow, and groundwater recharge occur naturally along river ways and creeks. However, between these
17 water bodies, the upper hardpan and clay surface soils hinder infiltration and base flow, resulting in greater
18 amounts of stormwater runoff. Further, the built environment produces large quantities of runoff.

19 Historic, pre-urban development land cover in the region includes barren lands of rock, sand, and clay;
20 deciduous, evergreen, and mixed forests; shrub and scrub; grasslands and herbaceous vegetation; pastures
21 and hay fields; woody wetlands; and emergent herbaceous wetlands.

22 Urban development, along with agricultural and drainage development, have altered the natural watershed
23 processes of the region in typical ways. Extensive amounts of natural, pervious vegetative land cover have
24 been converted to buildings, roads, and parking lots. The resulting imperviousness has reduced the amount

1 of infiltration, interflow, base flow, and evapotranspiration and increased overland flow volumes, velocities,
2 and peak flow rates. Such hydromodification has caused excess sediment transport into streams;
3 downstream erosion; flooding; disruption of natural drainage patterns, stream flows, and riparian habitat;
4 and elevated water temperatures in some locations (SSQP 2013b). In addition, anthropogenic activities
5 have introduced pollutants, which are transported through overland flow to downstream receiving waters.
6 This overland flow is comprised of stormwater runoff as well as dry-weather runoff – runoff from irrigation
7 water and wash water. Flood control projects and construction of dams for water supply and power
8 generation also result in hydromodification and increased pollutant transport. While intended to improve
9 economic function and citizen quality-of-life, these activities pose threats to a water body’s beneficial uses,
10 such as loss of habitat and biotic integrity or poor water quality. Section 2.5 discusses the specific water
11 quality, water supply, flood management, environmental, and community issues related to urbanization
12 within the ARB region watersheds.

13 It is important to note that climate change also affects watershed processes. Regional changes in weather
14 patterns (e.g., temperature and precipitation intensity, type, and frequency) will directly affect groundwater
15 and surface water supply. They also alter drainage, flooding, and erosion patterns within urbanized areas.
16 These changes, combined with California’s growing population, have increased reliance on pumping,
17 conveying, treating, and heating water, all of which are activities associated with the majority of greenhouse
18 gas emissions due to electricity and natural gas consumption (Central Valley Regional Water Board 2016).
19 These activities contribute to urbanization impacts on the region’s watershed processes.

20 Ideally, effective stormwater control measures should be tailored to the specific watershed processes that
21 have been effected. Although not quantified, there is significant evidence that the transport and storage of
22 water has been altered greatly. An increased concentration of nutrients and pollutants in local waterways
23 has been documented by regional monitoring. Elevated concentrations of suspended solids are sometimes
24 associated with construction but most often associated with scour and erosion of stream channels. The
25 degree to which cycling and transformations of nutrient, carbon, and minerals has been altered is unclear
26 but has been changed. The management of riparian corridors in the region does not usually consider natural
27 processes, including the decomposition of plant material performed by microorganisms. Lastly, ecological
28 succession of plant communities associated with creeks and wetlands is often not considered in the
29 management of these areas. Practices that might help to restore some of these processes are presented in
30 this plan. For example, deep infiltration of stormwater can help return overland flow to a pre-development
31 condition, thereby reducing pollutant and nutrient loading into waterways, minimizing scour and erosion
32 in waterways, and improving the amount of recharge to underlying aquifers. Changes in the management
33 practices near waterways, wetlands, and open spaces in upland areas can improve nutrient cycling,
34 decomposition, delivery of sediment to waterways, and plant community succession.

35 There is currently no regional, quantitative estimate of how much natural watershed processes (infiltration,
36 interflow, overland flow, etc.) have been altered. However, some regional tools such as the Sacramento
37 Area Hydrology Model (SAHM; Clear Creek Solutions 2013) and the Western Placer County Runoff
38 Reduction Calculator (West Placer 2016) can simulate these processes on a site scale, and are currently
39 being used for designing post-construction LID and hydromodification measures for some areas. UC Davis
40 is creating an in-depth guide to sands and gravels appropriate for recharge in the S. American and Cosumnes
41 Sub-basins. These tools and their associated management programs are helping to maintain natural
42 watershed processes within the region for new development and restore natural watershed processes for
43 redevelopment. Some agencies are also beginning retrofit projects to accelerate the restoration of natural
44 watershed processes in built-out areas that may not undergo redevelopment.

45

2.5 Watershed Issues and Priorities (IRWMP Sections 2.6.2, 2.7 to 2.9, & Apdx. B)

2.5.1 Water Quality

The ARB watersheds face multiple water quality issues that threaten the regional water body beneficial uses. Key among them are elevated concentrations of total suspended solids, pesticides, and metals. Chlorpyrifos and/or diazinon total maximum daily loads (TMDLs) are in place for many local waterways, including Elder, Elk Grove, Arcade, and Morrison Creeks. Numerous current stormwater pollutants (i.e., pyrethroids, suspended sediment, and nutrients) and legacy pollutants (i.e., banned organochlorine pesticides, chlordane, DDT, dieldrin) affect local waterways. The effects of hydromodification have also been observed in some regional streams and creeks. The Sacramento-San Joaquin Delta is listed as impaired for mercury and methylmercury; some National Pollutant Discharge Elimination System (NPDES) permittees within the ARB area have points of discharge within and upstream of the mitigation program area. The Lower American River may soon be listed as impaired for bacteria (Regional Water Board 2017). In addition, as California develops a statewide mercury TMDL program, upstream discharges may be subject to separate TMDL-like regulatory requirements (State Water Board 2017).

Local municipalities are following mandatory NPDES permit requirements to achieve compliance with existing or pending TMDLs and Basin Plan water quality objectives. This includes implementing pesticide plans, monitoring some waterways and urban discharges for regional pollutants of concern, and preparing for structural improvements to address requirements from the 2015 Trash Amendment. In addition, several regional agencies are addressing a waste load allocation for methylmercury as part of the Delta Mercury Control Program (DMCP). The agencies include the City of Sacramento Combined Sewer System (CSS); Regional San; the Department of Water Resources; and the SSQP municipalities. Section 3.0 of this SWRP cites all relevant TMDLs, NPDES permits, Waste Discharge Requirements (WDRs), and MS4 permits. Section 3.0 also describes the region’s water quality compliance efforts, including how this SWRP will contribute.

The water quality and aquatic habitat issues (see Section 2.5.4) in the region have led to a variety of voluntary efforts to explore low impact development (LID) and stormwater reuse practices suitable for local soil and climate conditions. Examples include several green street and LID retrofits on public lands, construction of the Elk Grove Rain Garden Plaza, a major LID retrofit on the Sacramento State campus, and a study to evaluate the risks of using deep infiltration technology (dry wells with pretreatment).

2.5.2 Water Supply

The region has significant water demands from municipal/industrial (M&I) and agricultural uses. The estimated 2010 regional M&I water demand was 780,000 acre-feet (ACF), and the projected 2030 demand is 950,000 ACF (a 22% increase). Potential water supplies include groundwater and surface water, which provide 40% and 60% of the regional water demand, respectively. Water demands will continue to be a challenge due to rapid population growth, increasing conflicts among water users, aging infrastructure and limited capacity, calls to decrease energy use, and uncertainties posed by climate change. It is anticipated that water supplies for the region will meet projected demands through 2030 only if conservation and demand management efforts are successful.

To meet water demand, climate change uncertainties, drought conditions, and regulatory requirements, water conservation is actively promoted in the region. Many municipalities fund “Cash for Grass” programs and “River-Friendly Landscape” training to promote water-wise gardening. Along with water districts, RWA also provides opportunities for water conservation through its water use efficiency programs (water meters; appliance rebates; irrigation scheduling for commercial agriculture; public education; plumbing retrofit) and training for river friendly landscaping. Conjunctive use of surface and groundwater supplies is a key water resource management strategy in the region, including over 20 years of promoting surface and groundwater supply interconnectivity. This has allowed for the reduction of surface water diversions during dry conditions in the watershed thereby protecting aquatic life in the Lower American River.

1 The SWRP will augment these water conservation and conjunctive use programs by promoting LID and
2 hydromodification management practices. Regional stakeholders are working with the State and Regional
3 Water Boards to develop standards for use of dry wells to allow for larger infiltration volumes and increase
4 groundwater recharge. Cisterns can store runoff for later discharge, thereby reducing peak discharge rates
5 and hydromodification efforts. Other LID devices such as infiltration galleries and basins can recharge
6 groundwater supplies. SWRP stakeholders will also coordinate with IRWMP members, including RWA,
7 to develop “in-lieu recharge” projects, where surface water and runoff is conveyed to groundwater services
8 areas during high-precipitation years, allowing the relevant communities to bank the groundwater for use
9 during drier years. SWRP projects that include flooding of agricultural areas and other fields will promote
10 infiltration and recharge of groundwater supplies. In addition, the Sacramento Regional County Sanitation
11 District is planning a project, in the South County area, to capture and use stormwater to dilute its recycled
12 water from the Sacramento Regional Wastewater Treatment Plant and recharge it into the groundwater by
13 surface spreading, thus helping to reduce the region's demand on surface water use; dilution of the recycled
14 water is required by Title 22 of the California Code of Regulations.

15 2.5.3 Flood Management

16 The ARB region is subject to flooding from small streams and creeks as well as the American, Sacramento,
17 and Cosumnes Rivers. Interior creeks are vulnerable to localized flooding in the winter. Large levees along
18 the banks of the major rivers are needed to safely contain the run-off produced by extreme floods in the
19 watershed. If not contained, such flooding could close down Interstate 5 and State Route 99, interrupt many
20 of the region’s heavily used rail lines, and cause billions of dollars of damage to structures in levee-protected
21 floodplains. Because the region is the largest urban area in the northern Central Valley, the risk of such
22 damage is a major concern.

23 Flooding is controlled in the ARB region largely through federal- and state-authorized facilities such as
24 Folsom Dam and the levees along the American and Sacramento Rivers and their tributaries. These federal-
25 and state-funded facilities are under the shared jurisdiction of the U. S. Army Corps of Engineers the Central
26 Valley Flood Protection Board. These agencies work with DWR and the regional flood control agency
27 (SAFCA) to develop and implement regional flood management projects aimed at protecting urban areas
28 against extreme flood events (less than 1/200 annual risk of occurrence).

29 LID or green street SWRP projects provide an opportunity to alleviate site-level flooding such as that often
30 experienced in streets or parking lots. For example, replacement of standard drain inlets with LID
31 stormwater planters can allow for filtration and capture of leaf debris, but still allow runoff to infiltrate and
32 be treated (and discharged if needed). This prevents clogging of storm drains and subsequent inundation
33 of roadways. LID and green street projects may also be used to replace failing storm infrastructure such as
34 settled pavement, inlets, or piping that cause localized street or parking lot flooding. Agencies and
35 developers can use SWRP projects to help reduce peak stream discharges and minimize downstream
36 impacts.

37 SWRP projects have the potential to alleviate larger, creek-level flooding in the long term as more LID and
38 green streets are implemented and more runoff is infiltrated and captured. Projects involving diversion of
39 runoff or storm flows to agriculture lands or other fields would also supplement localized flood control
40 efforts, as would projects involving habitat or flood plain preservation and enhancement. Finally, LID
41 projects can reduce storm-related flows in combined sewer systems, and thereby help minimize CSS
42 outflows and overflows, protecting public health and water quality.

43 2.5.4 Environmental

44 Urban development has increased the region’s reliance on electricity and natural gas consumption for water
45 sector activities like pumping, conveying, treating, and heating water. These activities are significant
46 contributors to greenhouse gas emissions and reduced air quality, posing threats to human and ecosystem
47 health. Urban development in the region has also introduced water quality pollutants and altered channel
48 morphology to the region’s rivers, creeks, and streams, ultimately resulting in reduced biotic richness.
49 Groundwater overdraft in the S. American and Cosumnes Sub-basins has diverted Cosumnes surface water
50 flows to groundwater recharge, resulting in salmon passage and stranding challenges, and affecting the

1 riparian habitat along the river corridor. Species and habit concerns related to these environmental issues
2 are well documented in the ARB IRWMP, as are each watershed’s management and stewardship efforts.

3 Within the ARB region, there are eight sensitive terrestrial communities and two sensitive aquatic
4 communities. There are also 17 sensitive plant and animal species that are listed as or candidates for rare,
5 threatened, or endangered status under the federal Endangered Species Act (ESA) and/or the California
6 Endangered Species Act (CESA). These species are strongly impacted by nonnative invasive species,
7 which occur in every type of habitat in the region. Areas dominated by nonnative weeds prevent native
8 plants from becoming established, provide poor habitat quality for wildlife, and discourage recreational
9 uses. Infestations of weed species increase hydraulic roughness during high-flow events, decrease the
10 capacity of the floodway, and adversely affect bank erosion and sedimentation processes. Some species
11 increase evapotranspiration, which can be detrimental to native species. Appendix B of the ARB IWRMP
12 tabulates the region’s sensitive species and habitats, as well as the invasive species.

13 Capture, infiltration, and use of runoff and storm flows through this SWRP’s projects will help mitigate
14 erosion and hydromodification effects, as well as reduce pollutant loads in receiving waters to protect and
15 restore aquatic habitats. In the long-term, there will be reduced reliance on pumping, conveyance, and other
16 water management activities that result in greenhouse gas emissions as more projects are implemented.
17 Other SWRP projects, such as stream bank stabilization or removal of invasive species, will help restore
18 and protect native habitat.

19 2.5.5 Community

20 While most DACs in the region are well served by the larger municipal agencies in which they exist in
21 terms of water supply, water quality, flood control, and environmental needs, there are other community
22 aspects that are left wanting. Several areas of the region, particularly DACs within larger municipalities,
23 have dense populations that lack open and recreational spaces. There is also intense competition for jobs
24 and housing, all of which can result in stress, crime, and health issues. The LID and green street projects
25 implemented under this SWRP will help revitalize, maintain, and promote healthy communities through
26 the creation of green and open spaces that improve neighborhood aesthetics. The resulting community
27 benefits could include increased jobs, sense of place, community focal point, well-being, and safety, and
28 provide connectivity to their creek corridors.

29 The SWRP projects will also help protect beneficial, recreational uses of the region’s waterbodies. Many
30 ARB region communities thrive on citizen and visitor recreation such as swimming, wading, waterskiing,
31 fishing, picnicking, sunbathing, hiking, camping, boating, hunting, sightseeing, or aesthetic enjoyment.

3.0 WATER QUALITY COMPLIANCE

3.1 Activities that Degrade Regional Water Bodies

The SSQP 2009 Stormwater Quality Improvement Plan provides a good summary of the activities that contribute to runoff pollution, degrade water bodies, and impair beneficial uses within the region:

“Creeks and rivers are a vital environmental and community resource, and their health depends on good water quality. One of the ways that pollutants can enter water bodies is through stormwater runoff. When land is developed, vegetation is replaced with impervious surfaces such as streets and rooftops; when it rains, water can no longer soak into the ground to the extent it previously could, and instead becomes stormwater runoff. Urban areas also generate what is referred to as dry-weather urban runoff (also called nuisance flows) – runoff from irrigation water and wash water, rather than from rain. Runoff collects pollutants as it flows along the ground surface. Streets and other vehicle-related areas accumulate sediments and other contaminants such as metals, oils and petroleum hydrocarbons. Urban runoff itself may also contain pollutants. For example, runoff from lawn or garden watering may carry pesticides, fertilizers or sediment. Runoff from vehicle and equipment washing typically carries detergents and other pollutants. The pollutants that are potentially exposed to/picked up by runoff vary depending on land use and activities. In developed areas, runoff flows into gutters, stormwater pipes (called storm drains) and channels, which, in the Sacramento area, discharge directly into creeks and rivers, along with any pollutants washed away with the runoff. Development also affects creeks by changing the volume and flow rate of water that flows into the creeks; the increased flows can cause erosion, degrade the creek habitat and also increase flood risks. Studies have demonstrated that runoff from the frequent small storms can cause downstream erosion, sedimentation and habitat impairment. Conventional flood detention approaches seek to manage (detain and slowly release) runoff associated with major storms, but do not address the runoff flows that cause chronic erosion and habitat impacts.”

Table 3-1 summarizes the various land uses, activities, and associated water quality impacts for the ARB region’s water bodies.

3.2 TMDL and Permit Compliance

TMDLs for chlorpyrifos and/or diazinon are in place for Delta Waterways, Elder Creek, Elk Grove Creek, Morrison Creek, Arcade Creek, and Chicken and Strong Ranch Sloughs. The SSQP, City of Sacramento CSS, and Sacramento Regional County Sanitation District (Regional San) have waste load allocations for the Delta methylmercury TMDL. Additional pollutants of concerns that are 303(d) listed (i.e., impaired) for the region include iron, diazinon, chlorpyrifos, copper, mercury, bacteria, fecal coliform, temperature, malathion, pyrethroids, sediment and unknown toxicity, dissolved oxygen, PCBs, pH, boron, chlordane, DDT, dieldrin, group-A pesticides, invasive species, and salinity. Table 3-2 lists the TMDL and 303(d) listings for the region as of 2012. Note that in December 2016, the Central Valley Regional Water Quality Control Board approved revisions to this list, but as of writing this SWRP, the State Water Board and EPA had not yet approved.

1 **Table 3-1. Land Use Activities and Water Quality Impacts in the ARB Region¹**

Land Use	Activity	Water Quality Impacts														
		Erosion	Increased Sediment	Increased Mercury	Increased Bacteria /Pathogens	Increased Trash	Increased Oils & Grease	Increased Pesticides	Increased Nutrients	Increased Metals	Increased Organics	Reduced Dissolved Oxygen	Altered/Destroyed Habitat	Channel Incision	Sedimentation	Temperature Changes

3 **Table 3-2. 2012 TMDL and 303(d) Listings**

Water Body	Water Quality Issues	Sources
Upper Cosumnes Watershed		
• Carson Creek	• 303(d) listing - aluminum, manganese	• Unknown sources
• Upper Cosumnes, Lower	• 303(d) listing - <i>E. coli</i> , invasive species, sediment toxicity	• Unknown sources
• Upper Cosumnes, Upper	• 303(d) listing - invasive species	• Unknown sources
• Deer Creek	• 303(d) listing - iron	• Unknown sources
Upper Bear Watershed		
• Bear River, Lower	• 303(d) listing – chlorpyrifos, diazinon, copper, mercury	• Unknown sources
• Bear River, Upper	• 303(d) listing – mercury	• Unknown sources
• Camp Far West Reservoir	• 303(d) listing – mercury	• Unknown sources
• Lake Combie	• 303(d) listing – mercury	• Unknown sources
• Gold Run	• 303(d) listing – mercury	• Unknown sources
• Little Deer Creek	• 303(d) listing – mercury	• Unknown sources
• Rollins Reservoir	• 303(d) listing – mercury	• Unknown sources
• Yuba River, South Fork	• 303(d) listing – mercury, temperature	• Unknown sources
• French Ravine	• 303(d) listing – bacteria	• Unknown sources
• Wolf Creek	• 303(d) listing – fecal choliform	• Unknown sources
• Yankee Slough	• 303(d) listing – chlorpyrifos, unknown toxicity	• Unknown sources

Water Body	Water Quality Issues	Sources
North Fork American Watershed		
• American River, North Fork	• 303(d) listing – mercury	• Unknown sources
• Folsom Lake	• 303(d) listing – mercury	• Unknown sources
• Hell Hole Reservoir	• 303(d) listing – mercury	• Unknown sources
• Oxbow Reservoir	• 303(d) listing – mercury	• Unknown sources
South Fork American Watershed		
• American River, South Fork	• 303(d) listing – mercury	• Unknown sources
• Slab Creek Reservoir	• 303(d) listing – mercury	• Unknown sources
Upper Coon – Upper Auburn Watershed		
• Curry Creek	• 303(d) listings – pyrethroids, sediment toxicity	• Unknown sources
• Kaseburg Creek	• 303(d) listings – pyrethroids, sediment toxicity	• Unknown sources
• Pleasant Grove Creek	• 303(d) listings – pyrethroids, sediment toxicity, dissolved oxygen	• Unknown sources
• Pleasant Grove Creek, South Branch	• 303(d) listings – pyrethroids, sediment toxicity, dissolved oxygen	• Unknown sources
Lower American Watershed		
• Arcade Creek	• TMDLs – chlorpyrifos, diazinon	• Urban runoff; agriculture (aerial deposition)
	• 303(d) listings – copper, malathion, pyrethroids, sediment toxicity	• Unknown sources
• Chicken Ranch Slough	• TMDLs – chlorpyrifos, diazinon	• Urban runoff agriculture (aerial deposition)
	• 303(d) listings – pyrethroids, sediment toxicity	• Unknown sources
• Miners Ravine	• 303(d) listings – dissolved oxygen	• Unknown sources
• Lake Natoma	• 303(d) listings – mercury	• Unknown sources
• Steelhead Creek	• 303(d) listings – PCBs	• Unknown sources
• Strong Ranch Slough	• TMDLs – chlorpyrifos, diazinon	• Urban runoff
	• 303(d) listings – pyrethroids, sediment toxicity	• Unknown sources
Upper Mokelumne Watershed		
• Amador Lake	• 303(d) listing – pH (high)	• Unknown sources
• Bear River	• 303(d) listing – copper, pH (low)	• Unknown sources
• Mokelumne River, Lower	• 303(d) listing – chlorpyrifos, copper, mercury, dissolved oxygen, unknown toxicity, zinc	• Unknown sources
• Rattlesnake Creek	• 303(d) listing – <i>E. coli</i>	• Unknown sources
Lower Sacramento Watershed		
• American River, Lower	• 303(d) listing - mercury, PCBs, unknown toxicity	• Unknown sources
• Cache Creek, Lower	• TMDLs - mercury	• Resource extraction
	• 303(d) listing – boron, unknown toxicity	• Unknown sources
• Coon Creek, Lower	• 303(d) listing – chlorpyrifos, <i>E. coli</i> , unknown toxicity	• Unknown sources
• Delta Waterways	• TMDLs – chlorpyrifos, diazinon, methylmercury	• Unknown sources
	• 303(d) listing – chlordane, DDT, dieldrin, group A pesticides, invasive species, unknown toxicity	• Unknown sources

Water Body	Water Quality Issues	Sources
• Duck Slough	• 303(d) listing – chlorpyrifos	• Unknown sources
• Elder Creek	• TMDL – chlorpyrifos	• Urban runoff
	• TMDL – diazinon	• Unknown sources
	• 303(d) listing – pyrethroids, sediment toxicity	• Unknown sources
• Elk Grove Creek	• TMDL – chlorpyrifos, diazinon	• Unknown sources
• Feather River, Lower	• 303(d) listing – chlorpyrifos, group A pesticides, mercury, PCBs, unknown toxicity	• Unknown sources
• Knights Landing Ridge Cut	• 303(d) listing – boron, dissolved oxygen, salinity	• Unknown sources
• Morrison Creek	• TMDL – diazinon	• Agriculture
	• 303(d) listing – PCP, pyrethroids, sediment toxicity	• Unknown sources
• Natomas Cross Canal	• 303(d) listing - mercury	• Unknown sources
• Steelhead Creek	• 303(d) listing – diazinon, mercury, PCBs	• Unknown sources
• Putah Creek	• 303(d) listing – boron, mercury	• Unknown sources, resource extraction
• Sacramento River	• 303(d) listing – chlordane, DDT, dieldrin, mercury*, PCBs, unknown toxicity	• Unknown sources
• Lake Solano	• 303(d) listing – mercury	• Unknown sources
• Sutter Bypass	• 303(d) listing – mercury	• Unknown sources
• Tule Canal	• 303(d) listing – boron, <i>E. coli</i> , fecal coliform, salinity	• Unknown sources
• Ulatis Creek	• 303(d) listing – chlorpyrifos, diazinon	• Unknown sources
• Willow Slough	• 303(d) listing – boron	• Unknown sources
• Willow Slough Bypass	• 303(d) listing – boron, <i>E. coli</i> , fecal coliform	• Unknown sources
• Winters Canal	• 303(d) listing – diazinon	• Unknown sources

1 *Bold text indicates TMDLs or 303(d) listing within ARB region*

2 Applicable NPDES permits, WDRs, MS4 permits, and state regulations are listed in Table 3-3. The
 3 municipal permits direct agencies on various activities they must do to protect water quality, including
 4 achievement of TMDL compliance. For example, the recently adopted Central Valley Regional Municipal
 5 Permit (Central Valley Regional Water Board 2016) requires the members of the SSQP – the County of
 6 Sacramento and the Cities of Sacramento, Citrus Heights, Folsom, Elk Grove, Rancho Cordova, and Galt
 7 – to develop a Stormwater Management Plan (SWMP). The SWMP must:

- 8 1. Identify priority water quality constituents (PWQCs) for which the permittee discharges are causing
- 9 or contributing to exceedances of water quality standards.
- 10 2. Identify milestones and strategies that “will ensure that...discharges will no longer cause or
- 11 contribute to exceedances of water quality standards in any receiving water.”
- 12 3. Include a reasonable assurance analysis (RAA) to demonstrate that proposed strategies will
- 13 “succeed in timely achievement of all water quality milestones, and final dates for attaining water
- 14 quality standards.”

15 At the time of writing this ARB SWRP, the SSQP was in the beginning stages of developing their SWMP.
 16 The Partnership submitted the PWQC identification and RAA approach proposal to the Central Regional
 17 Water Board in May 2017 and will develop a SWMP within one year of approval of the May 2017 planning
 18 documents. SSQP has historically identified target pollutants and developed individual pollutant control
 19 strategies to address them. Control strategies included source controls, load reductions through the

1 construction and implementation of new development elements, public outreach, and Integrated Pest
2 Management programs.

3 The smaller municipalities in the region are subject to the Phase II permit, which requires them to:

- 4 1. Reduce pollutant discharges to achieve TMDL waste load allocations, and
- 5 2. Not cause or contribute to an exceedance of water quality standards.

6 All SWRP projects will, in some way, support permit compliance through protection of water quality and
7 beneficial uses. Relevant permit requirements are incorporated into the SWRP through project
8 identification tools and benefit quantification tools. Projects installed by public agencies to assist with
9 NPDES permit compliance will be deemed in accordance with this ARB SWRP.

10 Several SWRP projects will include LID and green infrastructure practices, or site design measures such as
11 use or protection of stream setbacks and buffers or planting/preservation of trees, as cited in the Phase II
12 permit. These projects capture and retain/treat runoff, thereby minimizing stormwater discharge volumes,
13 reducing transport of pollutants to water bodies, and protecting beneficial uses. This directly aligns with
14 the ARB region NPDES permits, which require LID implementation and focus heavily on protection of
15 water quality and preservation of beneficial uses. In addition, the City of Sacramento’s CSS NPDES Permit
16 requires the City to implement a Combined Sewer System Improvement Plan (CSSIP), which primarily
17 addresses two NPDES permit requirements: the reduction of CSS discharges and in-system surface
18 flooding and outflows. The CSSIP update evaluated LID implementation and showed that LID can
19 augment the benefits of capital projects to the CSS by reducing runoff volume and potentially attenuating
20 the peak flows entering the system.

21 Other SWRP projects may include diverting storm flows from the region’s rivers or tributaries, of which
22 upstream urban runoff is a large contributor, to flood agricultural lands or other large fields for infiltration
23 and groundwater recharge. Diverting these flows will prevent negative hydromodification and water
24 quality impacts farther downstream and reduce downstream erosion and sedimentation, thereby supporting
25 permit requirements for protecting beneficial uses. SWRP projects that consist of in-lieu recharge would
26 also support permit compliance in this way. In-lieu recharge projects involve modifying infrastructure so
27 communities that regularly rely on groundwater can instead pull water from rivers and tributaries during
28 high flow periods, thereby banking groundwater for drier (lower flow) periods.

29 Finally, through data sharing, the SWRP can foster collaboration among regional stakeholders so that costs
30 for water quality benefit projects (e.g., costs for monitoring, data assessment, project management, and
31 design) may be shared. This can reduce overall costs, increase the likelihood of funding, and, in turn,
32 facilitate permit compliance.

33 **Table 3-3. Applicable NPDES Permits, WDRs, MS4 Permits, and State Regulations**

Permit or Regulation	Note
Central Valley Regional Municipal Permit (Central Valley Regional Water Board 2016)	Effective October 2016
City of Sacramento Wastewater NPDES Permit (Central Valley Regional Water Board 2015b)	Combined Wastewater Collection and Treatment System permit
Statewide Construction General Permit (State Water Board 2009)	As required through MS4 permits
Statewide Industrial General Permit (State Water Board 2015b)	As required through MS4 permits
Statewide Phase II NPDES/WDRs Municipal Stormwater Permit (State Water Board 2013)	Including pending updates to Appendix G (TMDL compliance)
Trash Amendments (State Water Board 2015a)	Only those applicable to inland surface waters
Title 22 of the California Code of Regulations	Direct recycled water recharge projects

4.0 ORGANIZATION, COORDINATION, AND COLLABORATION

4.1 Stakeholder Identification

Key stakeholders in the ARB region include:

- Water and groundwater supply, wastewater, recycled water, stormwater, flood management, and land-use agencies (Table 2-2)
- Groundwater management agencies (Table 2-4)
- RWA, the joint powers authority serving as the ARB region’s IRWM group lead
- SACOG
- California Native Plant Society
- Environmental Justice for Water Coalition
- Two federally recognized tribes
 - United Auburn Indian Community of the Auburn Rancheria (UAIC)
 - Wilton Rancheria
- School districts (Appendix D of this SWRP)
- Watershed stewardship groups, including non-governmental organizations that work on storm water and dry weather resource planning or management (Table 4-1)
- The general public, including DACs
- Park Districts
- Resource Conservation Districts

Table 4-1. Watershed Stewardship Groups

Watershed	Stewardship Group
Lower Sacramento Watershed	Sacramento River Watershed Program Friends of Auburn Ravine Valley Foothill Watershed Collaborative
Upper Bear Watershed	Bear River Work Group Placer County/Placer Legacy Program
Upper Coon-Upper Auburn Watershed	Placer County/Placer Legacy Program Ophir Area Property Owners Association Bear Watershed Stakeholder Group Friends of Auburn Ravine Placer – Nevada – South Sutter – North Sacramento (PNSSNS) Subwatershed Group Placer Nature Center American Basin Council of Watersheds Save Auburn Ravine Steelhead and Salmon Valley Foothill Watershed Collaborative
Lower American Watershed	Sacramento Area Creeks Council American River Parkway Foundation Dry Creek Conservancy Valley Foothill Watershed Collaborative
Upper Cosumnes Watershed	Laguna Creek Watershed Council Cosumnes River Partnership The Nature Conservancy Ducks Unlimited, Inc. Cosumnes Coalition Sacramento Valley Conservancy
Upper Mokelumne	Stone Lakes National Wildlife Refuge partnership

4.2 Stakeholder Involvement in SWRP Development

During development of this SWRP, local agencies and nongovernmental organizations were consulted, and other stakeholders were given opportunities to participate. Specifically, stakeholder involvement was provided at two levels: a “collaborator” level and a “general outreach” level. Collaborator involvement consisted of attending monthly planning meetings, providing resources such as maps and GIS files, reviewing draft versions of the SWRP and associated tools, and assisting with general outreach efforts. Project collaborators assisting at this level included over 40 individuals from over 20 agencies and organizations within the ARB region. Additionally, RWA provided guidance on integrating this SWRP with the existing IRWMP. RWA also updated its online planning tool and information center (OPTI) which disseminates information on ARB IRWMP projects. The tool was updated to accommodate the specific needs of identifying, ranking, and tracking projects developed for this SWRP. Sections 5.0, 6.0, 7.0, and 8.0 describe how OPTI will be used for various aspects of the SWRP implementation. Finally, the Office of Water Programs (OWP) at California State University, Sacramento, led the collaborative effort for developing the SWRP by facilitating the planning meetings; developing GIS files, maps, and tools; writing various drafts; and coordinating stakeholder outreach. Table 4-2 lists the collaborating entities and their responsibilities.

General outreach activities for development of the SWRP built upon prior accomplishments of the IRWMP. During the 2013 IRWMP update, extensive stakeholder outreach was conducted among the water community, the public, NGOs, DACS, and federally recognized tribes. For this SWRP effort, stakeholders were notified of activities and progress through (1) postings to RWA/OPTI websites, (2) briefings to the Water Forum Successor Effort, and (3) briefings to IRWMP stakeholders at regular semi-annual meetings. DAC, tribal, and school district representatives were invited to participate in the public review of the SWRP through introductory letters. Finally, as an NGO and primary team collaborator, the Valley Foothill Watershed Collaborative played a significant role in outreach efforts, leveraging the historic experience of their NGO partners in building community support for watershed stewardship. One example of their efforts included hosting a regional watershed conference in March 2018, which included presentations on the development, intent, and initial projects of this SWRP.

4.3 Stakeholder Coordination for SWRP Implementation

Many SWRP projects will be implemented or supported by individual agencies, such as municipalities. These projects will follow each agency’s existing planning, design, construction, monitoring, and maintenance procedures, policies, and regulatory requirements, as dictated by jurisdiction. Any necessary authorization or approvals by agency boards or directors will be sought at the project design stage; projects presented in this SWRP are considered to be at the conceptual planning stage. Each stakeholder with a project proposed in this SWRP has submitted a letter confirming that they are vested in the SWRP process (Appendix E). City councils and county boards of supervisors are issuing resolutions acknowledging and supporting this SWRP as well, and these are anticipated to be signed by the end of the 2017-18 fiscal year (June 30, 2018). A template of these resolutions is provided in Appendix F.

Agencies will use ARB IRWMP’s OPTI to coordinate plan implementation. As part of this SWRP’s development, OPTI was updated to accommodate the project implementation and tracking needs of this SWRP. Each SWRP project will be listed in OPTI during its planning stage and updated upon project completion to record actual field installations and any relevant performance information. In this way, OPTI allows multiple stakeholders, including agencies, to observe and track the various elements and stages of the project.

1 **Table 4-2. SWRP Collaborators and Responsibilities**

Collaborating Entity	Responsibilities
City of Auburn	<ul style="list-style-type: none"> • Attend planning meetings • Provide resources (GIS files, maps, tools) • Review SWRP drafts • Review of quantitative tools • Assist with public outreach
City of Citrus Heights	
City of Elk Grove	
City of Folsom	
City of Galt

Valley Foothill Watershed Collaborative	
Regional Water Authority	In addition to above responsibilities: <ul style="list-style-type: none"> • Guide SWRP integration with IRWMP • Update IRWMP management tool (OPTI) to address needs for ARB SWRP projects
Office of Water Programs at California State University, Sacramento	<ul style="list-style-type: none"> • Facilitate planning meetings • Develop GIS files, maps, and quantitative tools • Write SWRP • Coordinate stakeholder outreach

2 **4.4 Relevant Documents, Ordinances, and Programs**

3 Due to the large size of the region and number of stakeholders, there are dozens of documents, ordinances,
 4 and programs relevant to this SWRP. Appendix F of the ARB IRWMP tabulates several of them, although
 5 some have changed since the IRWMP adoption in 2013. A summary of the most relevant documents,
 6 programs, and ordinances are provided below.

7 The ARB IRWMP, in which this SWRP is incorporated, is a primary document that cites the existing
 8 resources and programs related to the supply, use, management, and protection of water within the region.
 9 The IRWMP serves as a backbone to this SWRP not only by providing a thorough summary of the ARB
 10 region watersheds and their stewardship programs, but also by providing an existing platform of stakeholder
 11 coordination, which will further the intent of using stormwater as a resource to support improved water
 12 quality, water supply, flood control, environmental, and community benefits.

13 Applicable NPDES permits, WDRs, MS4 permits, state regulations, and associated documents are listed in
 14 Table 3-3 and discussed in Section 3.1. To meet permit requirements, the municipal stormwater programs
 15 have developed stormwater management and discharge control ordinances, BMP guidance for businesses
 16 and charity car washing programs, as well as construction and post-construction runoff programs.
 17 Construction runoff programs include multiple resources for compliance such as guidance manuals,
 18 stormwater pollution prevention plan (SWPPP) templates, and inspections forms. Post-construction runoff
 19 programs include guidance resources for BMP planning, design, and maintenance. Other relevant
 20 documents include permit applications for civil improvements, easements, and encroachments. Because

1 these materials are frequently updated, combined with the sheer number of them, the specific titles are not
2 cited. Instead, the reader is referred to the stormwater webpages of each community for access to the most
3 recent information.

4 The projects listed in this SWRP, as well as future projects, will need to follow the applicable ordinances,
5 guidance, and requirements of the relevant municipality’s stormwater program. Planning and design of
6 projects must follow the applicable municipality’s design standards. Construction activities must follow
7 those dictated by the municipal stormwater construction program, including development and
8 implementation of a SWPPP. Plans should be developed to ensure proper operation and maintenance of
9 post-construction stormwater management controls, using the applicable municipal guidance. Finally,
10 planning, design, construction, operation, and maintenance must follow all associated ordinances.

11 Municipal general plans are also important resources for potential SWRP projects, as they list existing and
12 proposed community development plans, including those for protection, restoration, and creation of
13 recreational areas, parks, and open spaces.

14 Section 9.0 of this SWRP lists the primary references used to develop the ARB SWRP. Appendix G of this
15 SWRP provides an annotated description of these references, along with their relevance to the ARB SWRP.

16 **4.5 Individual Agency Participation**

17 Many SWRP projects will be site-level efforts implemented or supported by individual agencies, such as
18 municipalities, who are limited to spending their taxpayer dollars within their jurisdictions to directly
19 benefit their citizens, although there may be some larger, regional-level projects. This approach of
20 implementing multiple small, isolated projects throughout the watershed is anticipated to meet the
21 objectives of this SWRP, namely improving the management of stormwater as a resource and maximizing
22 watershed benefits related to water supply, water quality, flood control, and the ARB environment and
23 communities.

5.0 QUANTITATIVE METHODS

This SWRP outlines specific methodologies for quantifying and evaluating benefits of projects undertaken by regional stakeholders. Such projects can achieve an array of potential benefits, including increasing local capture, promoting groundwater recharge, reducing hydromodification, or directly improving downstream water quality. In the context of this SWRP, projects are any development and planning process, undertaken by a regional stakeholder, which upon completion contributes to the benefits outlined as part of the plan. Section 6 describes the SWRP methodology for identifying projects based on a multi-criteria decision-making framework in interest of achieving multiple benefits.

For each project developed under the SWRP decision-making framework, the SWRP provides specified procedures to assess benefits across a variety of habitat, water management, and energy reduction goals. These are introduced below, with detailed methods provided in the Appendix H. For purposes of this SWRP, projects are not evaluated on the basis of their financial feasibility or available funding, and designation as a SWRP project does not directly influence its likelihood of completion, only its potential for achieving multiple desirable benefits.

5.1 Integrated Metrics-Based Analysis

Table 5-1 presents the potential benefits and metrics to be evaluated for ARB SWRP projects. The benefits were based on the ability of projects to achieve desirable outcomes that address key watershed issues and priorities for the ARB region presented in Section 2.5. The benefit type (main or additional) listed in Table 5-1 is related to prioritization practices cited in the State Water Board’s SWRP guidelines (State Water Board 2015c; see Section 6.3). Table 5-1 also indicates the sources of quantitative methods to be used for each metric. Metrics for projects incorporating BMPs are calculated using the Appendix H worksheets. Metrics for other projects are calculated using appropriate modeling software, GIS tools or Google Earth, parcel maps, site topographic surveys, census data, and energy use and greenhouse gas (GHG) emissions estimate methods. The benefits, metrics, and quantitative methods presented in Table 5-1 and Appendix H were developed to provide an integrated watershed-based and metrics-based analysis that demonstrates how SWRP projects will support the ARB region’s water management objectives cited in Table 1-3.

The water quality benefits analysis estimates pollutant load reductions and volume reductions that will contribute to preservation, restoration, and enhancement of natural watershed processes and address NPDES permit requirements. TSS, dissolved copper, and *E. coli* were selected as representative constituents for quantifying load reductions associated with water quality benefits in the ARB Region. These constituents were based on the Priority Water Quality Constituents (PWQCs) identified by SSQP as part of their Reasonable Assurance Analysis (RAA) required by the regional NPDES permit. The PWQC list was developed from regional historic data and impairments related to urban runoff. A literature review was then conducted to gather treatment data available for structural BMPs commonly used in the ARB Region. For some PWQCs, insufficient data was available, but either TSS, dissolved copper, or *E. coli* was deemed an adequate surrogate. For example, TSS was selected to represent particulates and particle-bound constituents. Dissolved copper was selected to represent metals, and *E. coli* was selected to represent pathogens. For other PWQCs with insufficient data, design practices were determined to be the best way to ensure control measures. For example, trash will be controlled by following BMP selection and design standards. Table 5-2 lists the PWQCs identified by the SSQP and whether or not the PWQCs were included for the SWRP quantification of load reductions. Table 5-3 lists the influent and effluents concentrations used for quantifying load reductions for the included constituents. Appendix I provides a thorough description of the method for selecting constituents and assigning concentrations.

A list of initial SWRP projects and their quantified benefits is presented in Section 6.4. Appendix L provides summaries for select projects.

1 Table 5-1. ARB SWRP Benefits and Metrics

Benefit Category	Benefits	Benefit Type ¹	Metric	Unit ²	Quantitative Method			
					ARB SWRP Worksheets for BMP Projects	Appropriate Water Quality, Hydrologic, or Flood Model	GIS Tool, Google Earth, Parcel Map, or Topo Survey	Water-Energy Measure Calculator ³
Water Quality	Reestablishment of natural water drainage and treatment	Main	Volume of runoff reduced	afy	X	X		
	Increase in filtration and/or treatment of pollutants in runoff – TSS	Main	Load of TSS reduced	kg/yr	X	X		
	Increase in filtration and/or treatment of pollutants in runoff – dissolved copper	Main	Load of dissolved copper reduced	kg/yr	X	X		
	Increase in filtration and/or treatment of pollutants in runoff – <i>E. coli</i>	Main	Load of <i>E. coli</i> reduced	mpn/yr	X	X		
Water Supply	Increase in groundwater supply through infiltration	Main	Volume infiltrated to groundwater	afy	X	X		
	Increase in groundwater supply through in-lieu recharge	Main	Volume captured to offset demand	afy	X	X		
	Increase in surface water supply through direct use ⁴	Main	Volume captured to offset demand	afy	X	X		
Flood Management	Decrease in flood risk through reduced peak flow rates of runoff	Main	Rate of peak flow reduced for the 2-, 10-, 25-, 50-, and/or 100-year storm(s) as appropriate	cfs	X	X		
	Increase in area addressed for flood mitigation	Main	Size of area addressed for flood mitigation	acres	X	X		
	Decrease in combined sewer overflows	Additional	Volume of runoff reduced to combine sewer systems	afy	X	X		
Environmental	Enhancement, creation, and/or protection of wetlands, riparian zones, and aquatic habitat	Main	Size of area of wetland, riparian zone, or habitat enhanced, created, or protected	acres	X		X	
	Increase in urban green space	Main	Size of area created	acres	X		X	
	Improvement to instream flow rate	Main	Rate of instream flowrate improved	cfs	X	X		
	Decrease in energy use	Additional	Energy use reduced	kwh/yr	X			
	Decrease in greenhouse gas emissions	Additional	Mass of GHG emissions reduced	tonnes/yr	X			X
Community	Improvement in Water Temperature	Additional	Degrees of water temperature improved	degrees	X	X		
	Increase in public education	Main	Number of outreach materials provided or events conducted ⁵	# of outreach types	X			
	Increase in public involvement	Additional	Number of hours volunteered	hours	X			
	Creation or enhancement of public space	Additional	Size of public space created or enhanced	acres	X		X	

2 ¹Benefit types defined in the SWRP guidelines (SWRP 2015c)

3 ²afy = acre feet per year; kg/yr = kilogram per year; cfs = cubic feet per second; kwh/yr = kilowatt hours per year; mpn/yr: most probable number per year

4 ³Water-Energy Measure Calculator (2007): CA Public Utilities Commission Energy Division. June 2017.

5 ⁴Capturing runoff for non-potable indoor use, outdoor use, industrial use, or potable indoor use via wastewater treatment plant

6 ⁵Assign one point for each of the following outreach types, plus other similar activities: signage, brochures, websites, tours, presentations

1 **Table 5-2. Constituents Evaluated for Quantifiable Methods**

Constituent Group	Included/ Excluded for SWRP Quantification	Representative Constituent	Basis for Inclusion or Exclusion
Trash	<i>Excluded</i>	Non-organic material >5mm	Insufficient BMP performance and baseline data. Addressed through design standards adopted by each jurisdiction.
Pyrethroids	<i>Excluded</i>	Bifenthrin	BMP performance data are limited. Central Valley TMDL focuses on sediment control BMPs and other non-structural controls.
Legacy OP Pesticide	<i>Excluded</i>	None	Urban sources are effectively removed and delisting for urban waters is likely.
Mercury	<i>Excluded</i>	Methylmercury and Total Mercury	Insufficient BMP performance data, especially for methylmercury. Delta TMDL relies on sediment control BMPs. Address through design standards (“ensure BMP does not generate methylmercury”).
Fipronil	<i>Excluded</i>	Fipronil	Insufficient BMP performance data.
Pathogen Indicator	Included	<i>E. coli</i>	Sufficient performance data for most all evaluated BMPs.
Metals	Included	Dissolved Copper	Sufficient performance data for most all evaluated BMPs.
Dissolved Oxygen	<i>Excluded</i>	None	Urban runoff dissolved oxygen issues are flow/volume related (residence time) and are addressed through flow volume factors.
PAHs	<i>Excluded</i>	None	Insufficient BMP performance data. Trace contaminants that are addressed through solids and flow reductions.
Legacy OC Pesticide	<i>Excluded</i>	None	Insufficient BMP performance data. Addressed through solids reductions.
OP Pesticide	<i>Excluded</i>	None	Addressed through other pesticide reduction assessments.
Trace Contaminant	<i>Excluded</i>	None	Insufficient BMP performance data. Trace contaminant that is addressed through solids and flow reductions.
Total Solids/ Sediment	Included	TSS	TSS BMP performance data most available. Indicator of control efficiency and transport of solids adhered contaminants.
Salinity	<i>Excluded</i>	None	Not considered a significant urban runoff issue and would be addressed through assessment of flow reductions.
Biostimulatory	<i>Excluded</i>	None	Biostimulatory effects are “system” managed, and removal of nutrients does not ensure system response. Urban runoff generally not a source of nutrients as flow and residence time are the more significant factors.

2

1 **Table 5-3. Influent and Effluent Concentrations for Quantifying Load Reductions**

BMP Type	TSS		Dissolved Copper		<i>E. coli</i>	
	Median Influent	Median Effluent	Median Influent	Median Effluent	Median Influent	Median Effluent
	(mg/L)		(µg /L)		(MPN/100mL) ¹	
Constructed wetland	42	9.4	6.3	2.54	4,900	637
Pervious Pavement	42	24.5	6.3	5.05	4,900	4,900
Stormwater planter/ bioretention	42	9.9	6.3	5.79	4,900	101
Vegetated filter strip	42	19	6.3	5.28	4,900	4,180
Vegetated swale	42	21.6	6.3	5.64	4,900	4,180
Detention basins	42	23.3	6.3	2.86	4,900	3,000

2 ¹ MPN = Most Probable Number

3 **5.2 Integrating and Maximizing Benefits**

4 Benefit resulting from the ARB SWRP projects are maximized through the project identification and
 5 prioritization process identified in Section 6.0. The project identification methodology screens and rates
 6 site conditions from ideal-to-good-to-poor to-“deal breaker” using a numeric point system for various site
 7 features (referred to as screening factors) that influence the desired benefits identified in Table 5-1.
 8 Prioritization of SWRP projects relies on the number of achievable benefits and the implementability of the
 9 project (i.e., readiness-to-implement; financial viability is not included). Methods for quantifying and
 10 tracking specified benefits from a project were described in Section 5.3. The result is a host of feasible
 11 projects that have been selected and designed to address the region’s watershed issues and priorities. The
 12 use of consistent measures for quantifying and tracking benefits will further optimize watershed-based
 13 efforts and benefits as new projects are developed and added in the future.

14 **5.3 Data Management**

15 Relevant information for a project must be entered into OPTI (the ARB IRWMP’s online planning tool and
 16 information center) before the project can be considered as part of the SWRP. Project proponents enter all
 17 standard information required for any IRWMP projects into OPTI and indicate the project should be
 18 included in the SWRP using an OPTI check box. This will trigger a special SWRP tab within OPTI that
 19 requests additional information relevant to the SWRP requirements. Pre-project information includes:

- 20 • Is the project located on public lands?
- 21 • If not, does the relevant municipality have an easement or O&M agreement for the property?
- 22 • What type of benefits are expected (see Table 5-1)?
- 23 • What are the quantities of each benefit, if calculated?

24 Upon completion, post-project information to be added after project implementation includes:

- 25 • What were the actual benefits achieved (post-project), including their actual quantities?
- 26 • What were the actual construction start and completion dates (post-project)?
- 27 • What was the actual project cost (post-project)?

28 During the pre-project phase, the project proponent will enter all required IRWMP information along with
 29 details for the first four SWRP questions above. (The last three will be answered post-project, as described
 30 below). OPTI will then run an automated eligibility check and, if the project is deemed eligible, score the
 31 project and assign a prioritization tier (see Section 6.3). The project is then considered to be a SWRP
 32 project, and subject to stakeholder review following the standard IRWMP process (see Sections 7.0 and
 33 8.0).

1 During project implementation, data will be collected and evaluated following the relevant monitoring plan
 2 (MP), quality assurance project plan (QAPP), performance assessment and evaluation plan (PAEP),
 3 reasonable assurance analysis (RAA), permit, or other requirement necessary for the project. The data
 4 collection and evaluation activities, including the actual data, and findings, will be documented in relevant
 5 annual or mid- or end-term reports. All data will be uploaded to the California Environmental Data
 6 Exchange Network (CEDEN), Storm Water Multiple Application and Report Tracking System (SMARTS),
 7 the Surface Water Ambient Monitoring Program (SWAMP), the California Integrated Water Quality
 8 System (CIWQS), or the Groundwater Ambient Monitoring and Assessment Program (GAMA). Table 5-4
 9 lists the web links for each of these data management programs.

10 **Table 5-4. Data Management Programs and Web Links**

Data Management Program	Web Link
California Environmental Data Exchange Network (CEDEN)	http://ceden.org/
Storm Water Multiple Application and Report Tracking System (SMARTS)	https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.xhtml
Surface Water Ambient Monitoring Program (SWAMP)	http://www.waterboards.ca.gov/water_issues/programs/swamp/
California Integrated Water Quality System (CIWQS)	http://www.waterboards.ca.gov/ciwqs/
Groundwater Ambient Monitoring and Assessment Program (GAMA)	http://www.swrcb.ca.gov/gama/

11 Finally, upon project completion, the project proponent will need to enter the information for post-project
 12 as detailed in the last three bullet points listed earlier in this section. This post-project data will serve as a
 13 resource for future assessments of the watershed. Such assessments may include identification of data gaps
 14 and evaluation of existing water quality monitoring data. Section 7.4 describes the recommended
 15 performance assessments for the ARB SWRP.

1 **6.0 IDENTIFICATION AND PRIORITIZATION OF PROJECTS**

2 **6.1 Project Opportunities**

3 **6.1.1 Project Intent and Components**

4 Multiple projects have been identified to meet the goals and objectives of this ARB SWRP, and more will
 5 continue to be developed during the SWRP’s implementation and adaptive management phases. As
 6 directed in the SWRP guidelines (State Water Board 2015c), this SWRP includes projects and programs
 7 that are intended to capture and use stormwater and dry weather runoff for:

- 8 • Recharge of groundwater
- 9 • Restoration or preservation of natural watershed processes
- 10 • Direct use
- 11 • Flood control
- 12 • Community enhancement and/or
- 13 • Protection of beneficial uses, including habitat and improved water quality

14 Projects included as part of this SWRP are categorized as either an implementation project or a planning
 15 project. Many implementation projects will consist of installing LID BMPs (including green streets and
 16 dry wells) and restoration practices. However, to achieve multiple benefits and maximize feasibility,
 17 projects may include other components, as listed in Table 6-1.

18 **Table 6-1. Respective Components of SWRP Projects**

Implementation Project Components	Planning Project Components
• Install infiltrating LID BMPs, including dry wells	• Acquire/preserve land/open space
• Install or improve non-infiltrating BMPs (e.g., detention basins or cisterns)	• Conduct pilot and/or feasibility study
• Install infrastructure to improve stream flows	• Conduct monitoring
• Plant native vegetation	• Provide education & outreach
• Remove invasive vegetation	• Develop stewardship program
• Install fish screens	• Participate in true source control effort
• Enhance creeks/streams	• Plan an implementation project
• Remove legacy sediment	• Develop/update tools
• Breach levees	• Other
• Add infrastructure for in-lieu groundwater recharge	
• Add infrastructure for using storm or recycled water in lieu of surface water	
• Improve drainage infrastructure	
• Improve levees/flood walls (heighten, reinforce, add, etc.)	
• Replace turf with water wise vegetation (to reduce dry weather runoff)	
• Modify agricultural practices	
• Create or restore wetlands or riparian buffers	
• Other	

19

20

1 **6.1.2 Methods for Identifying Project Opportunities**

2 SWRP projects may be identified through existing regional efforts or by using new methodology and tools
3 created to support the SWRP planning efforts. Figure 6-1 illustrates these various efforts. The following
4 subsections provide specific details for each existing effort, as well as the new opportunity methodology
5 and tools.

* including RWA, the region's water supply joint powers authority

6
7 **Figure 6-1. Existing Efforts and New Methods for Developing SWRP Projects**

8 **6.1.2.1 Existing Efforts**

9 Prior to development of this SWRP, there were already many existing efforts in the ARB region to develop
10 multiple benefit projects and better manage stormwater as a resource. These efforts will continue during
11 implementation of this SWRP, and relevant projects will be incorporated into the SWRP through the project
12 tracking process described in Section 5.3. Existing regional efforts include:

- 13 • Water purveyor projects (including those conducted by RWA, the joint powers authority)
- 14 • Wastewater agency projects
- 15 • Flood control agency projects
- 16 • Municipal NPDES permit compliance programs
- 17 • Municipal capital improvement projects
- 18 • Sustainable groundwater agency projects
- 19 • Watershed stewardship organization efforts
- 20 • Municipal general plans and conservation plans

21 Summaries of example efforts and their relevance to SWRP projects are described in Appendix J.

1 *6.1.2.2 SWRP Opportunity Matrix, Scoring Worksheet, and GIS Tool*

2 This SWRP expands on existing regional efforts to formalize a methodology that may be used by any
3 stakeholder to identify multi-benefit, stormwater resource projects. The method involves evaluating site
4 conditions to identify potential locations where infiltrating BMPs (including infiltration LID devices and
5 green streets), dry wells, non-infiltrating BMPs, and restoration practices can be implemented to maximize
6 beneficial goals. As noted, these may include water supply, water quality, flood management,
7 environmental, and community benefits for the ARB watersheds. Note that dry wells are considered
8 separately from infiltrating BMPs because dry well performance does not rely on the hydrologic group of
9 the surface soils, while performance and feasibility of other infiltrating BMPs do. The specific BMP types
10 and practices are based on the ARB region’s four stormwater design manuals, as described in Section 6.2.

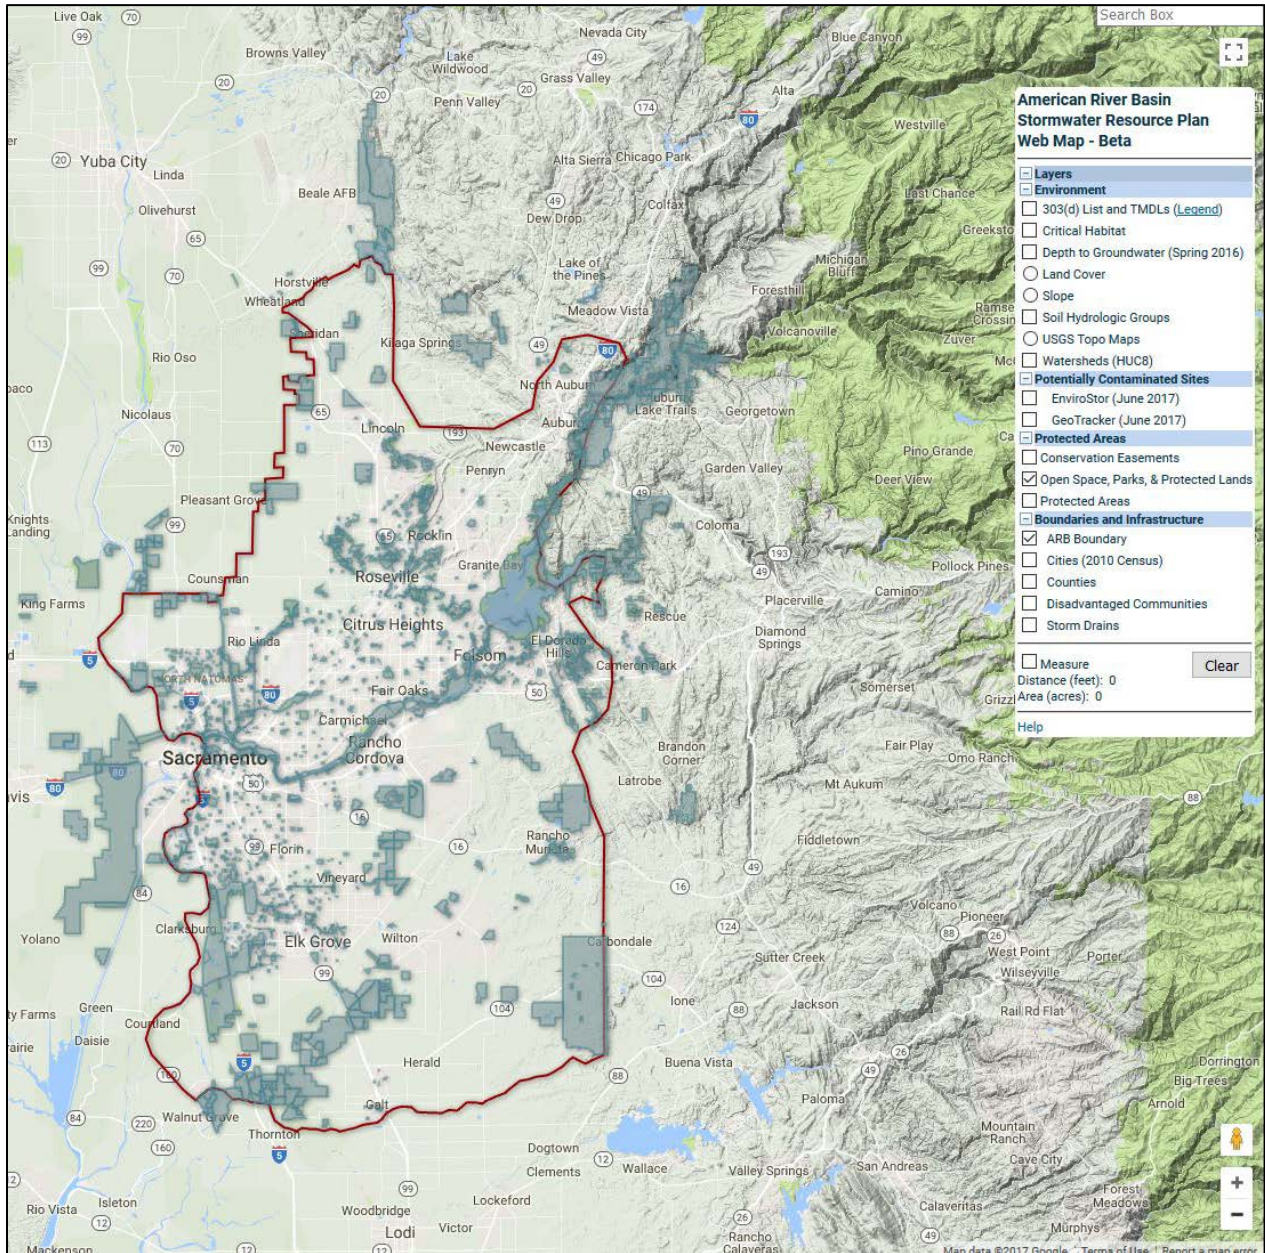

11 Table 6-2 presents a matrix that tabulates screening factors, site conditions, and various considerations that
12 can be used for evaluating potential projects. The matrix is intended to (1) help stakeholders identify
13 projects with ideal site conditions and (2) provide a ranking system that can help choose among potential
14 opportunities. Note that this ranking scheme is only intended for use prior to project design as a means to
15 screen opportunities. The matrix’s screening factors are site characteristics that typically influence the
16 SWRP’s desired benefits. In this way, the matrix combines evaluations of areas in need (e.g., high
17 imperviousness, land cover, draining to TMDL/303(d)-listed waters) with site conditions that influence
18 BMP performance and feasibility (e.g., subsurface soil types, depth to groundwater). The screening factors
19 are categorized as surface factors, subsurface factors, infrastructure factors, environmental factors, and
20 community factors. The matrix also lists the different site conditions that may exist for each factor. A
21 point value is assigned to each opportunity type (i.e., infiltrating BMPs, dry wells, non-infiltrating BMPs,
22 restoration practices) depending on the site condition. The associated points are multiplied by the weight
23 for each screening factor to calculate the total weighted points for each factor. These points are divided by
24 the total possible number of points for the relevant project component (infiltrating BMP, non-infiltrating
25 BMP, dry well, or restoration practice). This weighted methodology allows comparison among different
26 project components. The matrix includes notes describing why certain point values are assigned for certain
27 site conditions, as well as other considerations a project proponent should keep in mind when selecting
28 potential project locations. Finally, the matrix lists GIS and mapping resources where the specific site
29 conditions for each screening factor can be determined.

30 To support use of the Project Opportunity Matrix, the ARB SWRP includes a Project Opportunity Scoring
31 Worksheet. This is a Microsoft® Excel-based worksheet that allows users to enter project information and
32 automatically scores the project using the Project Opportunity Matrix point system. A screenshot of a
33 worksheet example is provided in Appendix K.

34 Another primary resource developed to support project identification is the newly released ARB SWRP
35 GIS tool. This is a dynamic and interactive web-based GIS tool and spatial data repository, which provides
36 information on surface, subsurface, environmental, and community characteristics for eastern Sacramento
37 county, western Placer county, and surrounding regions. The tool maps multiple data layers collected from
38 throughout the region, with references for the GIS layers located in the help section of the tool, as well as
39 in Appendix K. Figure 2-2 displays a screen shot of one map in the ARB SWRP GIS tool, showing the
40 ARB boundaries and open space, parks, and protected land GIS layers turned on. The web tool may be
41 accessed at <http://www.owp.csus.edu/ARBSWRP/map.htm>.

42 Note that most of the GIS layers available on the tool were obtained from regional, state-, or national-scale
43 resources, and may therefore not be accurate at high geographic resolutions such as individual project sites.
44 The tool is therefore intended as a planning tool; all site characteristics should be field verified before
45 investing in full design. The GIS layers of the tool may be transferred to local agency GIS systems, which
46 likely have more accurate, site-level characteristics. For example, the 303(d) List and TMDLs and Soil
47 Hydrologic Group layers from the tool could be overlain municipal parcel and outfall shape files to assist

- 1 in identifying public properties that directly drain to 303(d)-listed water bodies, with underlying soil types
- 2 ideal for infiltration.

² 100 ft separation is based on Sacramento County and Placer County septic system set back requirements for wells and surface waters

6.2 Project Design Criteria and BMP/Restoration Types

There are four primary stormwater design resources in use in the ARB region: the SSQP Stormwater Quality Design Manual (SSQP 2017a), the West Placer Storm Water Quality Design Manual (County of Placer et al. 2016), the City of Rocklin Post-Construction Manual (City of Rocklin 2015), and the El Dorado County West Slope Development and Redevelopment Standards and Post Construction Stormwater Plan Requirements webpage (El Dorado County 2017). At the time of writing this SWRP, El Dorado County was in the midst of developing a comprehensive stormwater manual that updates and merges individual guidance from their West Slope webpage.

Table 6-3 lists the jurisdiction applicable to each resource. The manuals and webpage documents establish the required design criteria for new and redevelopment projects as defined in each of the MS4 permits, and are considered to be the most appropriate design sources for retrofit projects that can maximize performance and maintain consistency. Therefore, all SWRP BMP projects will be designed following criteria in the manual from the project’s relevant jurisdiction. Design criteria for project components other than BMPs, including restoration practices, should follow the applicable local, federal, or state standards or best professional practice as appropriate.

Table 6-3. Stormwater Manuals for Each ARB Jurisdiction

Manual	Applicable Jurisdiction
SSQP Stormwater Quality Design Manual (October 2017)	City of Citrus Heights
	City of Elk Grove
	City of Folsom
	City of Galt
	City of Rancho Cordova
	City of Sacramento
	Sacramento County
West Placer Stormwater Design Manual (April 2016)	City of Auburn
	City of Lincoln
	City of Roseville
	Town of Loomis
	Placer County
City of Rocklin Post-Construction Manual (June 2015)	City of Rocklin
El Dorado County West Slope Development and Redevelopment Standards and Post Construction Stormwater Plan Requirements (July 2017)	Western El Dorado County

Table 6-4 classifies different types of BMPs and restoration practices that may be implemented in the ARB watersheds as infiltrating BMPs, non-infiltrating BMPs, and restoration practices. Alternative terms used among the region’s four different stormwater manuals are also listed (in parenthesis) for clarification.

1 **Table 6-4. BMP/Restoration Types**

Project Opportunity	BMP/Restoration Type
Infiltrating BMPs (including LID & Green Streets)	Bioretention Planter (Stormwater Planter [Infiltration]) ^{1,4} (Bioretention Facility) ^{2,3,4}
	Biostrip ³ (Vegetated Filter Strip) ¹
	Bioswale (Vegetated Filter Swale) ^{1,2} (Swale) ³ (Vegetated Swale) ^{1,4}
	Green Roof ^{1,2,4}
	Green Street ¹
	Infiltration Basin ^{1,3,4} , Gallery, or Trench ^{1,4}
	Porous Pavement ^{1,2,4} (Pervious Pavement) ³
	Rain Garden ³ (Compost Amended Soil) ¹ (Soil Quantity Improvement and Maintenance) ²
	Disconnected Impervious Surfaces (Disconnected Pavement or Roof Drains) ¹ (Rooftop and Impervious Area Disconnection) ^{2,4}
	Tree Planting and Preservation ² (Interceptor Trees) ¹
	Alternative Driveways ¹
	Wet pond or wetland
	Non-Infiltrating BMPs
Detention Basin ¹	
Lined (Non-Infiltrating) Planter (Stormwater Planter [Flow-through]) ^{1,4} (Flow-through Planter) ² (Tree Box Biofilter) ²	
Media Filter (Sand Filter) ¹ (In-Vault Media Filter) ²	
Vortex Separator or Drain Inlet Insert (Proprietary Device) ¹	
Restoration Practices ⁵	Bed and Bank Stabilization
	Riparian Buffer Enhancement and Protection ²
	In-stream Enhancement
	Floodplain Reconnection

2 ¹ Term used in SSQP Draft Stormwater Design Manual (SSQP 2017a)

3 ² Term used in West Placer Storm Water Quality Design Manual (County of Placer et al. 2016)

4 ³ Term used in City of Rocklin Post-Construction Manual (City of Rocklin 2015)

5 ⁴ Term used in El Dorado County Site Design Measures Manual (El Dorado County 2017)

6 ⁵ WERF 2016

7

1 **6.3 Project Prioritization Methodology**

2 SWRP projects will be prioritized based on the number of benefits they are expected to achieve, whether
3 those benefits have been quantified, and the implementability of the project. The prioritization scheme
4 encourages development of projects that maximize the number of benefits and are (near) ready to proceed.
5 This makes projects more likely to qualify for funding.

6 Projects will be prioritized through an automated process within OPTI, following a similar tiered approach
7 that is used for IRWMP projects. For SWRP projects, OPTI will first assess project eligibility by checking
8 that:

- 9 • Project will achieve at least 2 main benefits (as identified in Table 5-1)
- 10 • Project will achieve at least 1 additional benefit (as identified in Table 5-1)
- 11 • Project monitoring data will be entered into CEDEN or SMARTS

12 For eligible projects, OPTI then uses the inputted data for the project to calculate and assign a score for
13 each project's benefits:

- 14 • Provides ≥ 1 water supply benefit (+1)
- 15 • Provides ≥ 1 water quality benefit (+1)
- 16 • Provides ≥ 1 flood management benefit (+1)
- 17 • Provides ≥ 1 environmental benefit (+1)
- 18 • Provides ≥ 1 community benefit (+1)
- 19 • Benefits claimed above have been quantified (+3)

20 Based on the total benefits score, the project is assigned to one of four tiers:

- 21 ○ Score of 7-8 → Tier i
- 22 ○ Score of 5-6 → Tier ii
- 23 ○ Score of 3-4 → Tier iii
- 24 ○ Score of 2 → Tier iv

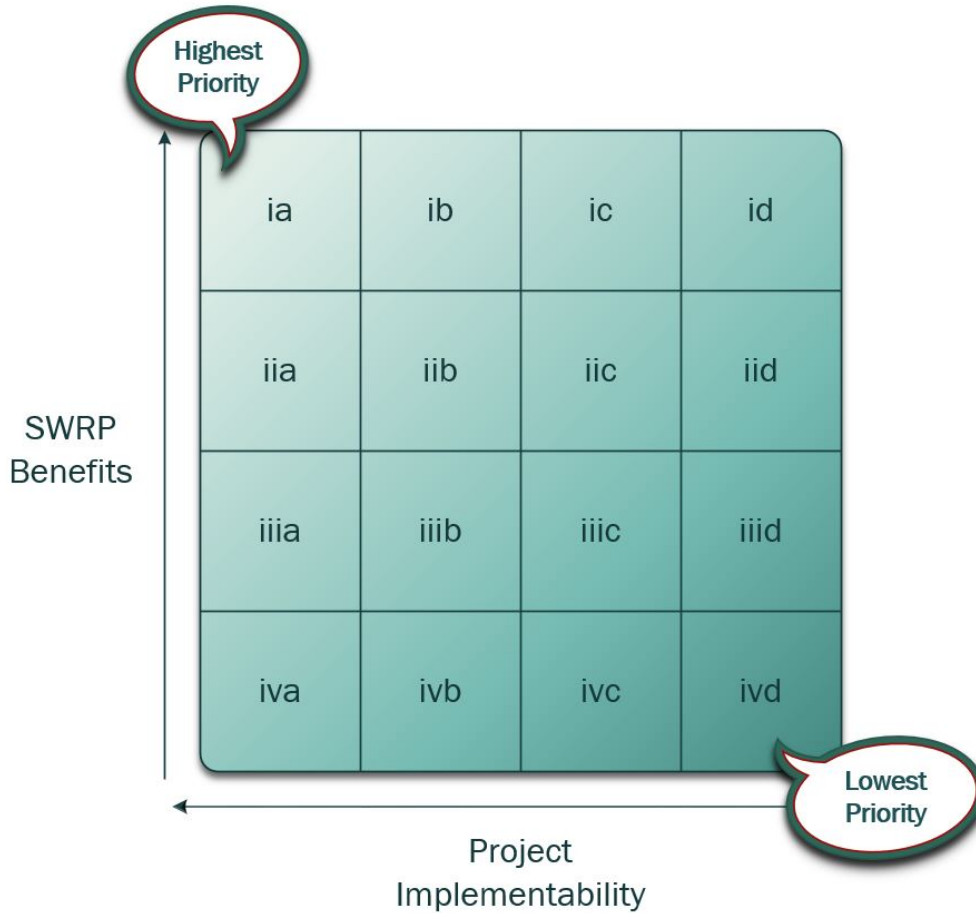

25 Next OPTI will assign a score for implementability:

- 26 • Readiness – project can be constructed within 2 years (+1)
- 27 • Feasibility – task schedule developed and necessary permits identified (+1)
- 28 • Budget – cost estimate complete and funding needs identified (+1)
- 29 • O&M – located on public parcel or local agency has easement or O&M agreement with land owner
30 (+1)

31 Similar to the project benefits, an implementability tier is assigned to the project:

- 32 ○ Score of 4 → Tier a
- 33 ○ Score of 3 → Tier b
- 34 ○ Score of 2 → Tier c
- 35 ○ Score of 1 → Tier d

36 These tiers are combined into a matrix, as shown in Figure 6-3, to give each project a final prioritization.
37 Projects with maximum benefits and implementability will fall into Tier ia, while projects with the lowest,
38 but still eligible, benefits and implementability will fall into Tier ivd. Note that unlike IRWMP projects
39 (for which RWA assigns the project ranking manually), no entity will be overseeing the real-time
40 prioritization of SWRP projects. It will be up to the project proponent to determine how to increase a
41 SWRP's priority and update the project information in OPTI, accordingly.

Figure 6-3. Prioritization Matrix for SWRP Projects

6.4 ARB Initial Project Listing and Rankings

OWP and the SWRP TAC solicited projects for inclusion in the SWRP between September 2017 and March 2018. The projects that were submitted were vetted by stakeholders through review of multiple drafts of this SWRP. The projects were then set into the prioritized tiers following the previously described methodology (Section 6.3). Table 6-5 lists the projects, lead organization, watershed and general location, and components. Table 6-6 lists the prioritization tiers and benefits for each project. Appendix L includes additional details for select projects in the form of summary sheets, including title, lead organization, a narrative description, tabulated benefits, location map, and supplemental images.

7.0 IMPLEMENTATION STRATEGY AND SCHEDULE

Implementation of the SWRP will occur at two levels: the project execution level and the watershed administrative planning level. The project execution level includes activities such as planning, designing, executing, and/or constructing projects. The watershed administrative planning level covers activities such as tracking projects and their benefits and revising the SWRP as data is gathered, lessons are learned, regulations change, and technologies advance. Project level implementation will be conducted by individual project proponents. Watershed level implementation will be coordinated by regional stakeholders as funding becomes available or needs develop. The following subsections describe the implementation resources and activities, adaptive management, and performance measures for these two implementation levels.

7.1 Resources Needed for SWRP Implementation

Table 7-1 summarizes the resources needed to implement the SWRP, as cited in the SWRP guidelines (State Water Board 2015c), as well as the ARB region’s relevant procedures to meet those needs at the project level and the watershed level. Funding and resources required for individual projects will be determined on a project-by-project basis by individual stakeholders (project proponents), who will also be responsible for securing the funding. Table 6-5 summarized the estimated costs and additional funding needs and resources for the initial list of SWRP projects. Many of these initial projects will be submitted for grant awards from the State Water Board’s Proposition 1 Round 2 Stormwater Grant Program and possibly from future IRWM or other grant programs. These awards and any other project funding will be listed in OPTI.

At the watershed level, this SWRP will be updated to reflect changes in regulations, technologies, or watershed health. Funding for future updates, including evaluations of performance data, will be obtained or provided as needed by one or more of this SWRP’s technical advisory committee members or a team of stakeholders. Specific watershed-planning level implementation activities are identified in Sections 7.2 through 7.4. One of this SWRP’s initial projects is to oversee and conduct these activities.

2 ¹ Needs listed in the SWRP guidelines (State Water Board 2015c)

3

1 **7.3 Adaptive Management**

2 An important component to effective, long-term stormwater planning is the capacity for regional agencies
 3 to implement adaptive management. Adaptive management emphasizes the potential to evolve current
 4 guidelines and practices in response to new data on how regional conditions respond to management
 5 actions. For stormwater, this means adjusting planning needs, monitoring guidelines, benefit
 6 quantifications, and project priorities based on the assessed health of regional watersheds. Table 7-3
 7 summarizes the adaptive management needs as cited in the SWRP guidelines and procedures for the ARB
 8 SWRP.

9 In general, the SWRP will be adaptively managed by:

- 10 1) Developing projects, quantifying their benefits, and adding them to OPTI, which will be an ongoing
 11 process conducted by individual stakeholders (as is done for the ARB IRWMP);
 12 2) Evaluating the need for the watershed level performance assessments described in Section 7.4,
 13 which may be done approximately every 5 years when the IRWMP is updated (pending available
 14 funding); and,
 15 3) Re-evaluating sources and updating metrics and analyses based on findings from the assessments.

16 When watershed assessments are conducted, OPTI will be reviewed to remove and update SWRP projects
 17 as appropriate.

19 ¹ Needs listed in the SWRP guidelines (State Water Board 2015c)

20 **7.4 Performance Measures**

21 Table 7-4 summarizes the needs and procedures to establish and use performance measures. These occur
 22 at two scales. First, at the project level, project proponents will be responsible for conducting an ARB
 23 SWRP Project Level Performance Assessment to quantify and evaluate project benefits, both expected and

1 realized. Performance measure procedures include monitoring, assessing, and reporting data. Project
 2 proponents will also be responsible for adjusting implementation of future projects to conform to any future
 3 revisions of the SWRP as appropriate.

4 Second, at the watershed level, a lead organization or team of stakeholders will coordinate an ARB SWRP
 5 Watershed Level Performance Assessment as described in Section 7.4.2. This includes comparing expected
 6 and actual benefits; obtaining and evaluating data from OPTI, CEDEN, and SMARTS; obtaining and
 7 assessing watershed health indicators; and adapting the SWRP based on the findings. The lead organization
 8 will also coordinate with RWA to present performance assessment updates at IRWMP meetings. Watershed
 9 level performance assessments will occur approximately every five years, dependent on available funding.

10 The project level and watershed level assessment methods are described in the following subsections.

11 **Table 7-4. Needs and Resources for Performance Measures**

Need ¹	Project Level Procedures	Watershed Level Procedures
Evaluations of expected vs actual benefits	<ul style="list-style-type: none"> • Project proponents conduct an ARB SWRP Project Level Performance Assessment • Project proponents enter estimated and actual project benefits in OPTI 	<ul style="list-style-type: none"> • Obtain estimated and actual benefits from OPTI • Stakeholders coordinate ARB SWRP Watershed Level Performance Assessment

12 ¹ Needs listed in the SWRP guidelines (State Water Board 2015c)

13 **7.4.1 ARB SWRP Project Level Performance Assessments**

14 Historically, the State Water Board’s Stormwater Grant Program has required Performance Assessment &
 15 Evaluation Plans (PAEPs) as part of applying for and receiving grant funding for projects. PAEPs identify
 16 project goals, desired outcomes, outcome indicators, measurement tools and metrics, and performance
 17 targets to guide stakeholders in evaluating the success of a project. The ARB SWRP includes a similar
 18 methodology for evaluating the performance of each individual project. Table 7-5 summarizes the relevant
 19 performance measures for these project level assessments. Potential project goals are based on the benefit
 20 categories identified in the SWRP: improving water quality, increasing water supply, supporting flood
 21 management, protecting the environment, and enhancing communities. The potential project outcomes are
 22 based on the benefit types identified in this SWRP: reestablishment of natural water drainage and treatment,
 23 reduction in pollutant loads, increase in groundwater supply, etc. Indicators for these outcomes are the
 24 specific metrics for each benefit: volume of runoff reduced and/or treated, load of TSS reduced, etc. For
 25 any project, performance assessments are only conducted for the benefits claimed when the project was
 26 added to the SWRP (i.e., added to OPTI). For each benefit claimed, the project proponent should attempt

1 to obtain or provide funds to conduct the relevant monitoring or measurements identified in Table 7-5. The
2 project proponent will then calculate the relevant outcome indicator (metric) based on the gathered data,
3 and calculate the percent of the estimated benefit that actually occurred. The estimated benefit would be
4 the value entered into OPTI, as calculated from the SWRP Quantitative Methods (Section 5.0). Finally,
5 that percentage will be compared to an established performance target.

6 This level of assessment provides an evaluation of the estimation methods and techniques for improving
7 project planning, design, and construction. Most grants require monitoring/performance assessments, so
8 this effort will likely be at least partly funded for grant-awarded projects. Performance assessments will
9 involve simple calculations with results that can be reported in OPTI for use in a later watershed level
10 assessment (Section 7.4.2)

11 Table 7-6 presents an example of assessing performance at the project level for a hypothetical installation
12 of multiple BMPs at a facility, including development of educational brochures, project signage, and a
13 project website. When the project was added to OPTI, the project team identified the following SWRP
14 benefits: reestablishment of natural water drainage and treatment, increase in filtration and/or treatment of
15 particles and particle-bound constituents in runoff, increase in groundwater supply through infiltration, and
16 increase in public education. These benefits serve as the desired outcomes for the performance assessment,
17 and their relevant benefit categories (improve water quality, increase water supply, and encourage
18 community stewardship) are the project goals. The outcome indicators are the metrics for each relevant
19 SWRP benefit. The desired quantities are the benefit values listed in OPTI, as calculated from the SWRP
20 Quantitative Benefits: 11.6 ac-ft of runoff reduced and treated (10.8 ac-ft infiltrated and 0.8 ac-ft treated),
21 1,500 kg of TSS reduced annually, 10.8 ac-ft of runoff infiltrated annually, and three types of outreach
22 materials provided. Before and after construction of the project, the project team conducted monitoring to
23 measure the volumes and loads that were actually infiltrated, treated, and discharged. The team also tracked
24 the outreach activities conducted. Then, for each metric, the actual quantity measured was divided by the
25 desired quantity to calculate a percentage that represents the performance achieved. Each percentage was
26 compared to the relevant performance target. For this project, three of the four targets were met. The
27 volume infiltrated to groundwater was overestimated due to a design that assumed a soil type not reflective
28 of actual site conditions, resulting in much less infiltration than was intended. This assessment resulted in
29 the recommendation that future projects include infiltration testing of on-site soils to better inform design.

30

1 Table 7-5. Project Level Performance Assessments

Performance Goals ^{1,2}	Desired Outcomes (SWRP Benefits ^{1,3})	Outcome Indicators (SWRP Metrics)	Measurement Tools and Methods ⁴	Performance Targets ⁵
Improve Water Quality	WQ1. Reestablishment of Natural Water Drainage and Treatment	Volume of runoff reduced and/or treated	<ul style="list-style-type: none"> Conduct field monitoring of pre- and post-project runoff volumes Calculate annual average volume reductions Calculate % of estimated volume reduction that actually occurred 	80% of estimated volume
	WQ2.a Increase in Filtration and/or Treatment of Particles and Particle-Bound Constituents in Runoff	Load of TSS reduced	<ul style="list-style-type: none"> Conduct field monitoring of pre- and post-project TSS loads Calculate annual average TSS load reductions Calculate % of estimated load reduction that actually occurred 	64% of estimated load
	WQ2.b Increase in Filtration and/or Treatment of Metals in Runoff	Load of dissolved copper reduced	<ul style="list-style-type: none"> Conduct field monitoring of pre- and post-project dissolved copper loads Calculate annual average dissolved copper load reductions Calculate % of estimated load reduction that actually occurred 	64% of estimated load

Support Flood Management	FM1. Decrease in Flood Risk through Reduced Peak Flow Rates of Runoff	Rate of peak flow of runoff reduced	<ul style="list-style-type: none"> Conduct field monitoring of pre- and post-project flow rates Calculate flow rate reductions Calculate % of estimated flow rate reduction that actually occurred 	80% of estimated peak flow rate
	FM2. Increase in Area Addressed for Flood Mitigation	Size of area mitigated	<ul style="list-style-type: none"> Conduct field survey of final area mitigated Calculate % of estimated area that was actually mitigated 	95% of estimated area
	FM3. Decrease in Combined Sewer System Overflows	Volume of runoff reduced in jurisdictions with combined sewer systems	<ul style="list-style-type: none"> Conduct field monitoring of runoff reductions Calculate volume reductions Calculate % of estimated volume reduction that actually occurred 	80% of estimated volume
Protect the Environment	E1. Enhancement, Creation, or Protection of Wetlands, Riparian Zones, or Habitat	Area of wetland, riparian zone, or habitat enhanced, created, or protected	<ul style="list-style-type: none"> Conduct field survey of final area enhanced, created, or protected Calculate % of estimated area that was actually enhanced, created, or protected 	95% of estimated area
	E2. Increase in Urban Green Space	Area of urban green space created	<ul style="list-style-type: none"> Conduct field survey of final area created Calculate % of estimated area that was actually created 	95% of estimated area
	E3. Improvement of Instream Flow Rate	Amount of instream flow rate improved	<ul style="list-style-type: none"> Conduct field monitoring of instream flow rates Calculate flow rate improvement Calculate % of estimated flow rate improvement that actually occurred 	80% of estimated flow rate
	E4. Decrease in Energy Use	Energy use reduced	<ul style="list-style-type: none"> Measure pre- and post-project energy use Calculate energy reduction Calculate % of estimated energy reduction that actually occurred 	80% of estimated energy use
	E5. Decrease in Greenhouse Gas Emissions	Mass of GHG emissions reduced	<ul style="list-style-type: none"> Calculate GHG reduction based on observed energy reduction Calculate % of pre-project estimated GHG reduction that actually occurred 	80% of estimated mass
	E6. Improvement in Water Temperature	Degrees of water temperature improved	<ul style="list-style-type: none"> Conduct field monitoring of pre- and post-project temperatures Calculate temperature improvement Calculate % of estimated temperature improvement that actually occurred 	80% of estimated degrees

Performance Goals ^{1,2}	Desired Outcomes (SWRP Benefits ^{1,3})	Outcome Indicators (SWRP Metrics)	Measurement Tools and Methods ⁴	Performance Targets ⁵
Enhance Communities	C1. Increase in Public Education	Number of outreach materials provided or events conducted ⁵	<ul style="list-style-type: none"> Count actual number of materials provided and/or events conducted Calculate % of desired number that was actually produced/conducted 	95% of estimated number
	C2. Increase in Public Involvement	Number of hours volunteered	<ul style="list-style-type: none"> Track and sum actual number of hours volunteered Calculate % of desired hours that were actually provided 	95% of estimated number
	C3. Creation or Enhancement of Public Space	Area of public space created or enhanced	<ul style="list-style-type: none"> Conduct field survey of final space created or enhanced Calculate % of estimated space that was actually created or enhanced 	95% of estimated area

1 ¹Not all goals or benefits will apply to all projects. Project proponents to determine which apply when submitting project to OPTI and conduct assessments only for goals and benefits claimed.
 2 ²Project goals are based on the multi-benefit categories established in the SWRP guidelines (State Water Board 2015c): water supply, water quality, flood management, environmental, and community.
 3 ³Desired project outcomes are based on the SWRP benefits listed in Tables 3 and 4 of the SWRP guidelines (State Water Board 2015c).
 4 ⁴ Estimated/desired metrics should be taken from the quantified methods in the pre-project design.
 5 ⁵It is assumed there should be no to minimal uncertainty or data variability in area- and count-based outcome indicators, so the performance targets are set at 95%. For all other indicators except those that are load-based, a 20% error associated with technology/equipment and methodologies is typical. The performance targets for these indicators are therefore set at 80%. For load-based indicators, there is a 20% error for volume measurements and a 20% error for concentration measurements. These are not mutually exclusive, and the resulting total error is therefore calculated as $1-(0.2+0.2-(0.2*0.2)) = 0.64$.

9 **Table 7-6. Example of Project Level Performance Assessment: Construction of an Infiltrating Stormwater Planter**

Performance Goals	Desired Outcomes (SWRP Benefits)	Outcome Indicators (SWRP Metrics)	Desired Quantity	Actual Quantity	Performance Achieved	Performance Target ¹	Target Met?	Discussion	Recommendation
Improve Water Quality	WQ1. Reestablishment of Natural Water Drainage and Treatment	Volume of runoff reduced and/or treated	11.6 afy	11.0 afy	95%	80%	Yes	—	—
	WQ2.a Increase in Filtration and/or Treatment of Particles and Particle-Bound Constituents in Runoff	Load of TSS reduced	1,500 kg/yr	1,100 kg/yr	73%	64%	Yes	—	—
Increase Water Supply	WS1. Increase in Groundwater Supply through Infiltration	Volume infiltrated to groundwater	11.0 afy	7.7 afy	70%	80%	No	Project design assumed hydrologic soil group type B, but actual on-site soils were type C, resulting in much less infiltration	Test on-site soils to determine infiltration rates prior to design
Enhance Communities	C1. Increase in Public Education	Number of outreach materials provided or events conducted	3	3	100%	95%	Yes	1. Developed project brochures 2. Installed on-site signage 3. Created virtual walking tour	—

10 ¹ Targets established for the ARB region, as listed in Table 7-5.

1 7.4.2 ARB SWRP Watershed Level Performance Assessment

2 The technical advisory committee involved in developing this SWRP decided that a variety of performance-
3 assessment approaches is needed to best address the diversity of needs, interests, and limitations of the
4 region's stakeholders. The ARB municipalities can only provide services (including tasks associated with
5 performance assessments) within their jurisdictions. SSQP has proposed using a stochastic model approach
6 for compliance with the RAA requirements of their NPDES permit. SSQP is awaiting approval from the
7 Central Valley Regional Water Board, and timelines for future updates have not been developed. This
8 model will only focus on water quality in SSQP jurisdictions; it does not evaluate flood control, water
9 supply, or other performance goals nor does it cover areas outside the SSQP jurisdictions. Municipalities
10 in Placer County are Phase II permittees and do not have regulatory drivers or funding to commit to
11 sophisticated watershed-wide performance assessment models, so a cumulative project benefits approach
12 is proposed to address these constraints but still provide data to quantify improvements over time. This
13 option is also reasonable from a scalability perspective: most SWRP projects will be site-scale and LID. A
14 large number of projects will need to be implemented before a difference is observable in receiving waters
15 and sub-watersheds to make informed decisions for adaptive management. Finally, watershed stewardship
16 stakeholders would like to see aquatic indicator performance assessments done, but there is a lack of
17 regulatory drivers and funding to commit to these. This option was included in the case that funding
18 becomes available in the future, as it was deemed a valuable option, especially for watershed health from
19 an aquatic habitat perspective.

20 With this in mind, watershed level performance assessments for the ARB region will be conducted in
21 various ways, according to the specific needs of the agency or stakeholders leading the effort. The
22 assessments may be done across one or all of the ARB region's watershed or sub-watersheds. A watershed
23 level assessment for the ARB region could use cumulative project benefits, a watershed model, or aquatic
24 indicators to evaluate the impact of projects on watershed health, as described below.

25 *7.4.2.1 Cumulative Project Benefits*

26 A simple watershed assessment could be done by summing the benefits achieved across all SWRP projects
27 within a defined watershed, sub-watershed, or group of watersheds. This information can be used to
28 estimate how much SWRP projects are contributing to ARB IRWMP and SWRP goals and objectives. In
29 the future, these cumulative quantities could be used to quantify the potential for SWRP projects to
30 contribute to future IRWMP targets; as of the time of writing this SWRP, the ARB IRWMP did not have
31 numeric targets for its goals and objectives.

32 *7.4.2.2 Modeled Benefits*

33 Watershed models can simulate the long-term effects of land use changes on watershed processes,
34 uses/diversions, and pollutant loadings. The affected watershed processes include overland flow,
35 groundwater recharge and infiltration, interflow, evapotranspiration, in-stream delivery of sediment and
36 organic matter, and chemical and biological transformations. The simulations are based on user-defined
37 parameters such as topography; land use, cover, and slope; stream locations, flows, and depths; runoff
38 outfall locations, discharges, and pollutant concentrations; hydrologic soil groups; and precipitation and
39 evaporation rates. Models can estimate watershed-scale benefits, such as meeting critical in-stream flow
40 criteria, critical in-stream temperature criteria, receiving water limitations, and beneficial uses.

41 Such models would be most useful in refining the locations of BMP, flood control, and restoration projects
42 to reduce runoff discharge volumes and pollutant loads, increase water supply, mitigate hydromodification
43 effects, and reduce greenhouse gas emissions and flooding. Such a model could quantify the SWRP benefits
44 through a more dynamic, holistic, watershed scale, possibly in lieu of the project-site scale. Many forms
45 of such models are being used by California municipalities to plan and demonstrate compliance with their
46 MS4 permits. Appendix M provides a more thorough discussion of potential watershed model approaches.

1 Note that as required by their NPDES permit, SSQP submitted an approach for conducting a Reasonable
2 Assurance Analysis (RAA) on their Alternative Compliance Pathway (ACP) for meeting receiving water
3 limitations to the Central Valley Regional Water Board in May 2017 (SSQP 2017b).

4 *7.4.2.3 Aquatic Indicators*

5 Aquatic indicators are key environmental parameters of water quality and flow, which are deemed to be
6 significant for critical species. They are often specific to watersheds and individual species. Aquatic
7 indicators could support more thorough assessments of aquatic habitat quality in the ARB region's
8 watersheds, beyond the environmental metrics identified for the SWRP benefits (Section 5.0).

9 The region has a detailed relevant example that regional runoff management efforts and the SWRP can
10 build upon. In 2015, the California Office of Environmental Health Hazard Assessment (OEHHA) and Dry
11 Creek Conservancy developed aquatic indicators to assess aquatic habitat quality in the Dry Creek
12 Watershed (OEHHA and DCC 2015). The Dry Creek project involved conducting a sub-watershed level
13 study to identify parameters that best indicated Dry Creek Watershed's conditions and stressors. The
14 resulting indicators included biological measurements (e.g., fall-run Chinook salmon fish counts and
15 benthic macroinvertebrate measures), water quality concentrations/loads (TSS, metals, pesticides, and
16 dissolved oxygen), physical habitat measures (streambed sediments and instream cover, flow diversity, and
17 temperature), in-stream flashiness, and urban development (land use and cover). To use this method for
18 other areas of the ARB region, studies would need to identify appropriate indicators for each subwatershed;
19 each waterbody has its own unique physical habitat and aquatic health conditions, and, therefore, aquatic
20 indicators are not identical from one waterbody to another. The indicators would need to be monitored
21 over time, and desired (quantified) outcomes would need to be identified.

1 **8.0 EDUCATION, OUTREACH, PUBLIC PARTICIPATION**

2 The ARB region has multiple existing opportunities that will be used to engage the public in development
3 and implementation of the SWRP and its projects. These mechanisms include:

- 4 • OPTI
- 5 • IRWMP semi-annual meetings
- 6 • RWA announcements
- 7 • Municipal programs
- 8 • VFWC activities
- 9 • 2018 Watershed/LID Conference

10 The following subsections describe how these opportunities support public participation. Table 8-1
11 summarizes which opportunities address various public participation elements required by the SWRP
12 guidelines (State Water Board 2015c).

13 **Table 8-1. Opportunities to Engage the Public in SWRP Implementation**

Public Participation Element	Opportunities to Engage the Public					
	OPTI	IRWMP Semi-Annual Meetings	RWA Announcements	Municipal Programs	VFWC Activities	2018 Watershed/LID Conference
Mechanisms, Processes, and Milestones for Facilitating Public Participation during SWRP Development and Implementation	X	X	X	X	X	X
Mechanisms to Engage Communities during Project Design and Implementation	X	X		X	X	
Identification and Inclusion of Specific Audiences		X		X	X	
Strategies to Engage Disadvantaged and Vulnerable Communities		X		X	X	
Efforts to Identify and Address Runoff-related Environmental Injustice Issues		X		X	X	
Schedule for Public Engagement and Education*	X	X		X	X	X

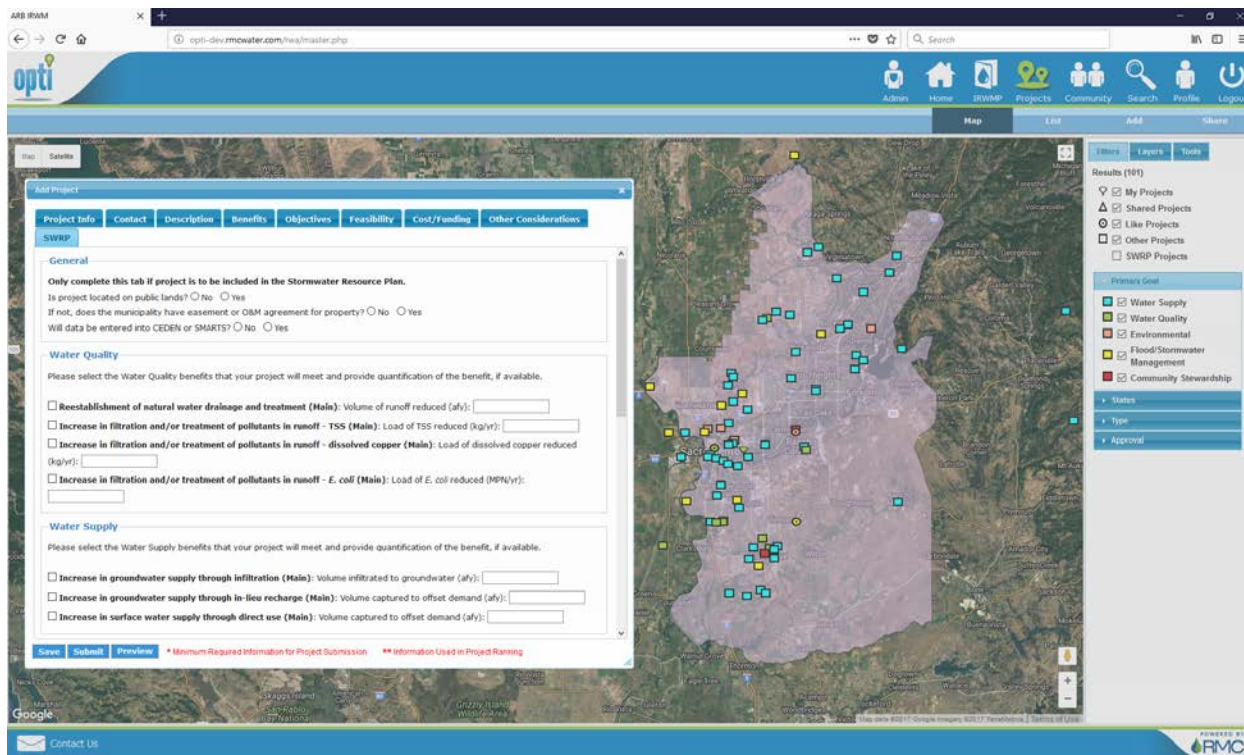

14 *Timelines for public participation activities are described in the relevant opportunity subsections.

15 **8.1 OPTI**

16 OPTI was originally developed to add and track projects for the ARB IRWMP. During development of
17 this SWRP, OPTI was updated to add capabilities for submitting and tracking information relevant to
18 SWRP projects. To add SWRP projects to OPTI, project proponents enter the same information as that
19 required for IRWMP projects, along with several additional details used in OPTI for prioritizing projects
20 (as described in Section 6.3). In this way, SWRP projects will also potentially qualify as IRWMP projects,
21 subject to the vetting process described below. Figure 8-1 shows a screen shot of the user interface for the
22 specific information that is needed for SWRP projects.

23 Stakeholders can access OPTI using the guest mode to view and comment on projects. Alternatively, they
24 can create usernames to become members of the “community,” allowing them to add and edit projects.
25 Projects can be added and edited at any time, and the project proponent can share the project information
26 with any member of the community. The project is not visible to the remainder of the community until the

1 proponent selects the “submit” button. The project then undergoes a stakeholder vetting process. At the
2 close of each quarter (i.e., March 31, June 30, September 30, and December 31), RWA distributes a
3 summary of projects submitted over the previous quarter and allows stakeholders one month to comment.

4
5 **Figure 8-1. Screen Shot of IRWM On-line Planning Tool Information Center (OPTI) Update**

6 **8.2 IRWMP Semi-Annual Meetings**

7 RWA hosts semi-annual IRWMP meetings (in April and October) to discuss relevant projects, updates, and
8 issues. All stakeholders are welcome to attend, and may request that SWRP topics, including specific
9 projects, appear on the agenda for any of these meetings. These IRWMP meetings will also serve as
10 opportunities to discuss how to 1) identify and include audiences impacted by SWRP activities, 2) engage
11 DACs and vulnerable communities, and 3) identify and address environmental injustice issues.

12 **8.3 RWA Announcements**

13 RWA maintains an email distribution list of OPTI members that is used to announce IRWMP information.
14 As needed, stakeholders may request that RWA use this list to disseminate specific SWRP information.

15 **8.4 Municipal Programs**

16 Each municipality within the ARB region has established processes to allow the public to review and
17 comment on plans, documents, and projects developed by their programs. These processes will be followed
18 as needed for SWRP implementation. For example, prior to the approval of design or construction of a
19 project, that project may go through a public vetting process required by the local jurisdiction. (Note,
20 however, that most but not all projects will be vetted as applicable; it will depend on the size and scope of
21 the project.) The process will engage local ratepayers, developers, commercial and industrial stakeholders,
22 nongovernment organizations, and the general public.

23 Through their individual networks, the municipalities within the ARB region will also announce activities
24 related to implementation of the SWRP, including identifying additional projects. Targeted audiences will
25 be parks, transportation, drainage, and capital improvement departments. Appendix N includes the call-
26 for-projects template that assists the SWRP development collaborators in describing the intent of the SWRP

1 and in gathering the initial list of SWRP projects. The call-for-projects period occurred September 2017
2 through March 2018. This template may be adapted as needed in the future to solicit additional projects or
3 information for SWRP updates.

4 As previously cited, most of the disadvantaged and vulnerable communities in the ARB region exist as
5 pockets within larger municipalities and are served by those municipal agencies. Municipal staff will
6 engage DACs directly on a project-by-project basis. In addition, the needs of isolated DACs are being
7 tracked through the IRWMP and will be discussed at the semi-annual meetings as needed.

8 **8.5 VFWC Activities**

9 VFWC is a regional partnership that shares expertise from nonprofit, government, and private organizations
10 to help implement priority projects for watershed health. They help nonprofit, government, and private
11 partners connect to pooled services and resources for project planning, funding, volunteers, integrating
12 related projects, and outreach. In this capacity, VFWC can provide and promote SWRP projects and
13 practices that assist disadvantaged and vulnerable communities and address environmental injustice issues.

14 **8.6 2018 Regional Watershed/LID Conference**

15 For over a decade, Dry Creek Conservancy has hosted regional LID conferences that address LID topics
16 specific to Sacramento County and western Placer County, including the previous conference in 2015. The
17 most recent conference, held March 1, 2018 at Cal EPA headquarters in Sacramento and co-hosted by
18 VFWC, the State Water Board, and OWP at Sacramento State, expanded the program to encompass other
19 watershed health topics, including development of this SWRP and its projects. Save-the-date
20 announcements were distributed in December 2017 to previous conference participants as well as the
21 collaborators that produced this SWRP. Conference coordinators announced availability of conference
22 registration in February 2018. The conference served as the public outreach meeting for development and
23 initial implementation of the SWRP, and occurred on the first day of the SWRP's public review period
24 (March 1 through March 31, 2018) to allow adequate time for feedback and other activities if needed.
